PREFACE TO THE 64¹⁰ ANNUAL VOLUME.

The formation of the National Government and the subsequent General Election leve brought about many changes in the sixty-fourth annual issue of "Whitaker," published early in December in order that it may be available for transmission overseas before the end of the year. The Cabinet as finally reconstructed and the new House of Commons are included, together with articles on the Financial Crisis and Government by Party, with a tabular record of Administrations from Pitt to Mac Donald. Statistical Tables are also provided to show the source of the World's Food and other Products, and the quantities and places of origin of Great Britain's Food Imports.

The preleanary results of the Census of Lugland, Wales and Monmouth and of Scotland are duly recorded, with similar figures for the Indian Empire, the Union of South Mirica, and for Dominions where the taking of the Census was not postponed on economical grounds. Final figures for last year's Census of the United States are also provided, but the results of the commentation in Canada are not yet available.

Questions of the Day are again treated in separate articles ranging in alphabetical sequence from "Allotinents for Unemployed to "The Weir Report." These are followed by Annual Summaries of The Year's Weather, Storms, Ploods, Science and Invention, Laterature, Art. Music. Drama, The Films, and Broadcasting

In order that the varied contents may be available for instant reference, the Index has again been enlarged and now consists of 140 columns, containing upwards of 20,000 references.

Many suggestions made by correspondents have been adopted, but in some cases action was delayed by pressure due to the political situation, and the consequent change of addition had perforce to be postponed. The Editor-m-Chief is deeply grateful to his collaborators for their valuable assistance during the past year and hopes the result of their co-operation will encourage them to continue the work of preserving and increasing the usefulness of a book which has become so familiar to all who read or speak the language in which it is printed.

Correspondents are carnestly requested to note the first day of October as the last day for suggestions to reach the Office, at the address given below.

The Hottingham Guardian

circulates in every part of a busy area, containing a

Population of over 2,500,000

engaged in the LACE, HOSIERY, BOOT and SHOE, ENGINEERING, CHEMICAL, TOBACCO, MOTOR CYCLE, COAL MINING, IRON and AGRICULTURAL INDUSTRIES, in the five counties of Nottinghamshire, Derbyshire, Leicestershire, Lincolnshire and Rutland.

The Nottingham Guardian

maintains an active, efficient, and thoroughly up-to-date

TRADE INTELLIGENCE BUREAU

the value and practical utility of which to manufacturers and business men, at home and overseas, is proved by the thousands of inquiries that are dealt with every year.

Inquirers may obtain from the Secretary of the Bureau "Nottingham Guardian," Nottingham:

Particulars of trade marks and branded goods. Introductions to manufacturers & buyers in every trade.

The Bureau works reciprocally with all the leading Trade, Government, and Commercial organisations in all parts of the world.

ITS SERVICES ARE ENTIRELY FREE.

London Office: 67 Flect Street, E.C.4.

THE BURBERRY BOOK

tells many things you ought to know about The Burberry—the world's best Weatherproof and one of the world's best Overcoats. A copy, with patterns of cloths and prices, post free on mention of "Whitaker's Almanack."

Don't

worry about the weather

wear THE BURBERRY and be dry and comfortable whatever happens.

THE BURBERRY provides perfect protection in every kind of weather; supplies everything you ask of a Weatherproof or of an Overcoat.

It keeps one dry when it rains and warm when it's cold. It's a staunch shield against bitter winds, yet (and this is very important), airylight and naturally ventilating, the coolest and most comfortable top-coat for warm days.

wear

THE BURBERRY

and be

dry & comfortable whatever happens

THE COCKTAIL HABIT

T is a point of fact (and facts—the hardest possible—are the only things the present generation can be expected to take seriously) that Alcohol and its disabilities are no longer exclusively the province of men. In the days when "drink," to use that vulgar but convenient term, meant heavy wines, brandy, whisky, and the coarser spirits, there was very little temptation for women to indulge in it. But things are very different now. Europe has become "cocktailised," and there is, unfortunately, no form of Alcohol more dangerous and at the same time more adapted to the feminine palate.

A cocktail is a strong pick-me-up; it has approximately the effect of a glass of champagne; and it is drink which can be taken at almost any hour. Can anything more tempting, more seductive, and, though she probably does not realise it, more intensely demoralising to the woman of to-day, with her arduous and multifarious duties, be imagined?

THE COCKTAIL HABIT IS THE EASIEST IN THE WORLD TO SLIP INTO.

You are tired after a long day -- a couple of cocktails help you to shine at dinner, may also make a dull lunch bearable; they also . . . but why enumerate? Taken at regular intervals like medicine (and that is the way they are consumed by a multitude of men and women), they perform their extraordinary task of getting you through the day." In time you come to rely upon them ... but, of course, you tell yourself, it is only during the season, or while you are so busy; you can always give them up. You try to do so—and you cannot. You try again. You are cannot. miserable, low, depressed, as you yourself admit, "not fit to speak to," and in ninety-nine cases out of a hundred you again give in. It is inevitable, for the alcoholic habit is scarcely ever broken unaided. Circumstances are too much against it. But if, when you first realised your

addiction to this—or any ether—form of stimulant, you consulted the Turvey Treatment Association, all your worry, depression, the worst of all human ills, and general unhappiness would be cured—and cured quickly. Instead of struggling vainly and unsuccessfully, you would be able to regard your temporary bondage as an evil dream from which you have awoken. The Turvey Treatment necessitates neither nursing homes, doctors, nor injections—nothing which could conceivably interfere with the ordinary course of life.

The following inquiry form may be filled in and forwarded (or a letter written), on receipt of which full particulars and advice will be forwarded under plain cover.

TEAR OFF AND POST.......
Confidential.

To the MEDICAL SUPT. BRITISH T.T. ASSOCIATION.

HANOVER HOUSE.

14 HANOVER SQUARE, LONDON, W. I

(Entrance, Harewood Place.) Telephone: Mayfair 3406 (2 lines). Telegrams: Turvert, Wesdo, London.

ROYAL SOCIETY MEDALS, 1931.

The King has approved of the following F.R.S., for his distinguished researches in optics awards by the President and Council of the and terrestrial magnetism Royal Society :-

A Royal Medal to Sir Richard Glazebrook, K.C.B., F.R S., for his distinguished work in experimental physics

A Rayal Medal to Professor W. H. Lang, F.R.S., for his work on the anatomy and morphology of the fern-like fossils of the Old Red Sandstone.

The following awards have also been made :-

The Cooley Medal to Sir Arthur Schuster, structure by X-ray analysis

The Davy Medal to Professor A. Lapworth, FRY, for his researches in organic chemistry, particularly those in convexion with tautomerism and the mechanism of organic reactions.

The Sylvester Medal to Professor E. T. Whittaker, F.R.S, for his original contributions to both pure and applied mathematics

The Hughes Medal to Professor W. L. Bragg for his pioneer work on the elucidation of crystal

THE COLLEGE OF ESTATE MANAGEME

(Incorporated by Royal Charter)

35, Lincoln's Inn Fields, London, W.C.2.

Complete Courses of Preparation for the Examinations of

CHARTERED SURVEYORS' INSTITUTION.

Students are prepared by whole-day tuition at the College or in Evening Classes, or by Postal Tuition.

THE GOLD MEDAL LAST YEAR WAS WON BY A COLLEGE STUDENT. Apply, THE REGISTRAR.

BRITISH BEET SUGAR.

The production of Beet for Sugar in England and Wales from small beginnings around the year 1832 has now grown to an area of 348,000 acres farmed by 40,000 growers, producing in 2930 3,060,000 tons of Beet (washed weight) fetching an average price to the grower of 50.8. per ton delivered factory. Eighteen factories thus produce 420,000 tons of sugar and employ 9,900 workmen for over 100 days of the year in addition to about 30,000 workers employed in the fields (part time, about 4 months in the year). The dried pulp residue fetched in 1929-30 about £650 000 and the trading profit to the factories, after paying £673,000. The subsidy paid by the Government in 1929 amounted to £4,230,700 and for 1930 was estimated at £6,230,000.

Great Britain and Northern Ireland consume per annum a total of 1,850,000 tons of Sugar, or golb. per head of population.

3 10 17 24	8 7	50 25 0	12 12 12 11	utha 56 32 8 44	16 16	39 16 53

time of the rising which happens during that day, and the figures in the two following columns show the time of the southing and of the setting which next follow that rising, and these sometimes happen after the midnight which ends the day. In such cases the figures are in heavy type, and it is to be remembered in using this table that these distinctive figures always indicate a time on the morrow of the day of its line. A similar system is followed in the Tables of the planets. (See pages 5, 9, 13, &c.) In the ephemerides of the planets on page 3 of each mosth, italic figures are occasionally used (pages 8, 12, 16, 44) to indicate the change of sign of the declination noted in the heading

Double High-Water.—Among the Tidal-Constants on pages 52 and 53 it will be seen that for Southampton and some other places near the Isle of Wight two times of High Water are indicated, differing by two or three hours. This is the result of observation, but an explanation sometimes advanced that it is the effect of the combination of two tides, one of which passes round the Island, advanced that it is the effect of the combination of two fides, one of which passes found the Island, the other arriving normally, is believed to be erroneous. In shallow water the main idial oscillation generates a secondary oscillation of small range and half the period of the main oscillation, and normally in an estuary this tends to accelerate high water and to retard low water. In the neighbourhood of the late of Wight the normal relationship of primary and secondary oscillation is disturbed and the four maxima of the secondary tide become prominent at Southampton, and the four minima at Portland, so that at the former place there are double high waters and at the latter there are double low waters.

* The days thus indicated throughout the Almanack are those on which High Tules may be expected. Strong northerly which in the North is a and a low barometer with heavy rams in the countres drained by the Thumes may cause a higher mac of the rive, and the low large reversed chaircate to be fooded.

MORNING AND EVENING STARS.

O MERCURY uses before the Sun in the first part of the month, but will not be seen.

P VENUS continues to be an evening star setting later night by might, and grows bughter. It will be a prominent object in the south-west sky in the early evening. Magnitude -35 to -3.6.

J MARS rises almost with the Sun throughout

of MARS rises almost with the Sun throughout the month and sets before, so that it will not be visible

? JUPITER being in Opposition on the 7th, is above the horizon throughout the night. It will be due east at altitude 20° at about 6 o'clock in the evening in the middle of the month. Magnitude 21.

b SATURN rises rather more than an hour before the Sun in the S.E. by E 1 to a scarcely likely to be visible Magnitude +0 8.

Bissextile.—When Julius Cosar reformed the Roman Calendar in the year 46 B.C., 263% days was adopted as the mean length of the year, that being the value then current in Egypt. Three out of four years were given 365 days, and the fourth, 366 days, the sixth day before the Kalendas of March being repeated. The intercalary day came to be called ante diem bis sextum Eatendas Martias, or more briefly bissextum, whence our word bissextile for leap-year.

Before the introduction of this calendar the Roman year consisted of 385 days, with a month of 23 days intercalated after February 23 when necessary. This intercalation had, however, been sometimes omitted, and it was found necessary to make the year 46 B.C. consist of 445 days.

MORNING AND EVENING STARS.

MERCURY at Greatest Elongation (E) on March as is an evening star. It may be seen ten days before that date, for a few innutes shortly before 7 o'clock, but it sets later, and the interval for observation will be longer on the following evenings, when it may be seen low down, a few degrees north of west.

Q VENUS at sunset will be placed in the west-south-

Q VENUS at sunset will be placed in the west-southwest at altitude between 30 and 40 degrees. It will be near the Plenades at the end of the month. Magnitude

-3.6 to -3.8.

d Mars continues to rise and set nearly with the Sun, and will not be visible either in the morning or evening.

21 JUPITER is high in the south-east sky in the twilight and above the horizon until dawn. It is now midway between the Twins and Regulus. Magnitude -s.o.

b. SATURN rises at dawn, and will be 5 degrees above the horizon in the south-east at 5 o'clock at the end of the mouth, but is not likely to be conspicuous. Magnitude +o'9.

April 15. Uranus rises 5h. 1m., sets 18h. 19m. Neptune rises 14h. 0m., sets 3h. 50m.

The Planet Venus.—Venus is now very prominent in the evening sky, and at the end of April does not set until 10 minutes before midnight. This is periodic, and occurs every eighth year, i.e. in alternate leap-years. The planet describes her orbit round the Sun in 22 77 days, and 23 of these periods are very nearly the equivalent of 8 solar years. It is also the case that the synodic period of Venus, which is the interval between successive conjunctions with the Sun, superior or interior, or the interval in which the faster moving interior planet gains a lap on the Earth, is 324 days, and five of these are equal to 8 solar years. Consequently, at intervals of that number of years, greatest eastern elongation occurs at the same time of year, and at spring elongations. Venus is at a part of her orbit which is then seen high above the Equator, and these

MORNING AND EVENING STARS.

- § Mercury in the early days of the month will be above the horizon for an hour after sunset. It will be a morning star after the roth, but in neither case is it likely to be seen.
- Q VENUS will not set until so minutes before midnight at the end of the month It moves through the constellation Tau us and adds to the hillnance of the western evening sky. Magnitude -3*8 to -4 s.
- g MARS is still not visible, for it rises only a few minutes before the Sun and sets much earlier.
- If JUPITER is due south in the early evening. It reverses its direction of motion and moves slowly in the constellation Cancer towards Leo after the 9th. Magnitude -19 to -17.
- 12 SATURN in Capricornus uses less than a hours after midnight at the end of the month, and may be seen at a low altude in the east-south-east in the early dawn. Magnitude +ag.

are the reasons for the circumstances mentioned. The high altitude in early evening may be explained otherwise by saying that at this time of year in this latitude the ecliptic is inclined to the horizon at a large angle at sunset; Yenus, like all the planets, is somewhat near the ecliptic, and her distance from the Sun, which is on the horizon, measured on the ecliptic is also large, since she is at or near maximum clongation. Circumstances are somewhat similar,

The planet will be at greatest western elongation on September 8 of this year, when it will rise shortly after z o'clock, the hour being thus early for reasons that are akin to those given above.

Jupiter without Satellites.—It is shown in these pages (see pp. 3s. 36 and 58) that each of Jupiter's larger Satellites is eclipsed, occulted by, or is in transit across the planet's disc at regular intervals. These events are sometimes contemporaneous, and Jupiter is therefore seen occasionally as though it had only three, two or even one Satellite, and on rare occasions all four may be hidden in this way simultaneously and Jupiter is said to be without Satellites. The length of the intervals between such occurrences follows no law. In the 200 years 2800 to acco there have been, or will be, 35, and it chances that three of them happen in the space of the two years current. Juniter's four large Satellites were simultaneously invisible, exterior to the planet, for 24 hours in the evening of 1931, Feb. 14. This will happen from 3h. 24m. to 4h. 20m. in the morning of May 4, and again from 2h. 12m. to 2h. 32m. in the morning of November 21 of

MORNING AND EVENING STARS.

MERCURY is a morning star, but rises too near to the time of sunrise to be seen.

Q VENUS is still above the horizon until nearly midnight, and will be due west at altitude 30° about 8 o'clock. It moves into the constellation Gemini and will be in the neighbourhood of the Twins at the end of the month. Magnitude - 4's (Greatest Brilliancy).

of MARS begins to be a morning star since it rises an hour before the Sun at the end of the month; in the E.N E.

14 JUPITER is high in the south-west at sunset, and will be seen when the sky grows dark. It sets nearly in the west-north-west in the hour or two after midnight. Magnitude -r.7 to -r.5.

Iz SATURN is now more prominent as a morning star since it rises before midnight at the end of the month. Magnitude + 08 to + 0'6.

this year. At the time Jupiter is without Satellites on May 4 the planet will be below the horizon at Greenwich, but the phenomenon may be observed from America and places not so far west. On the second occasion the planet will be about 13° above the horizon at Greenwich, at 2h. 12m, when Satellite IV will be eclipsed, and at that time II will be in transit, and III and I undergoing occultation, reappeasing at 2h. 2sm. and 2h. 46m. respectively. Satellite II will complete its transit at 3h. 33m.

CONJUNCTIONS, ECLIPSES, AND OTHER CELESTIAL PHENOMENA.

June x. Civil twilight ends at xth. 3m. There is no closed night in this month in the latitude of london. The length of the Day from Sunrise to Sunset on June x is x6h. x4m. Its length is nearly x6h. 34m. from the 19th to the 24th. June x, 4h. Mars in conjunction with). 3 5° S.

June 3, xxh. Mercury in conjunction with \mathcal{D} \mathcal{O} 5° 8.

June 6, 22h Venus in conjunction with D. 9 3°S.

June 7. Venus at a stationary

point.

June 9, 10h. Jupiter in conjunction with D. 4 208

June 13. Mercury in Superior conjunction.

June ax, xh Saturn in conjunction with D. 12 3° N

June 21, 15h. Sun enters the sign Cancer (Solstice).

June 29. Venus in Inferior con-

In this month the Mornings increase about 7m up to the 17th, and then decrease 4m. The Afternoons increase about 14m. up to the 25th, and then decrease sheltly.

Constellations near the S. meridian at midnight Corona, Hercules, Ophinchus, Serpens, Scorpus, Lyia, Aquila, Sagittarius.

APPARENT RIGHT ASCENSION AND DECLINATION OF THE PLANETS AT NOON.

June 15 Uranus rises 1h 6m, sets 14h. 36m. Neptune rises 10h. om., sets 23h. 50m.

Photo-Electric Photometry.—Electrical properties that are developed in certain substances under the influence of light have led to methods of measuring luminosity and its variation and have been adapted for several practical uses. The element selenium may be said to be a non-conductor of electricity when in the dark but becomes a conductor along which a current will pass when light falls on it, the strength of the current varying with the intensity of the light. It has also been found that some metallic substances, seven of which are known, potsasium being one, shed electrous under the influence of light, and hence become electrically charged, leading to the production of current, the rate of charge being proportional to the light intensity. Devices embodying these principles known as selenium and photo-electric cells are in use for astronomical photometry. Placed in the focus of a telescope objective the light of a star falling on the receiver of a cell of either kind causes a current to flow or a charge to accumulate that can be

MORNING AND EVENING STARS.

- MERCURY is a morning star at the beginning of the month but will not be seen. It will be an evening star after the 13th, but its visibility is again barely possible.
- Q VENUS remains a brilliant object to be seen north of west after sunset in the early days of the month, but becomes fainter rapidly, and sets in the early twilight, in the latter part
- of MARS rises a hours, more or less, after midget in the brightening sky in the N E by E.
- M JUPITER now not very far to the west of Regulus is to be seen almost due west in the early evening; but the time for its visibility is short for it sets before midnight. Magnitude -1'5 to -1'4.
- b SATURN is in the south-east, approximately, at midnight, at altitude 10 to 15 degrees. Magnitude +06 to +0.8.

registered, and the implining light measured with remarkable accuracy With the photo-electric cell differences of density of deposit on a photographic negative, which is an essential of many astrophysical researches, can be determined with similar precision. Photo-electric cells have other can be determined with similar precision. Photo-electric cells have other uses besides those of astronomy. They are essentials in the processes of television or picture telegraphy; of talking cinema pictures and in the construction of burglar alarms that depend on the interruption of the impliging ray. A proposal to use the light of Arcturus to start machinery at the clinicage World Fair in 1933 is evidently based on the action of a photo-electric or selenium cell. The current or other effect caused by that would bring stronger currents into action.

that would bring stronger currents into action.

Thermometry.—Temperature and its changes are commonly measured by a thermometer of which the expansion of mercury is the basic principle, but there are electrical thermometers whose action depends on a certain electrical property of metals that is developed under the influence of heat.

The thermo couple, or thermopile, depends on the fact that a thermo-electric force is produced when a circuit, in which a galvanometer may be included, is formed of two metals, necessarily with two junctions, and one of the junctions of the two metals is at a higher temperature than the other. If, for example, in a circuit of copper wire with a length of iron inserted, one of the junctions is made hotter than the other, the galvanometer will show a current passing in the direction from copper to iron at the hotter junction, the statement being subject to some qualification. A sensitive instrument of this kind is used in astronomy, and with a vacuum thermo-couple made of bismuth and bismuth-tin placed in the focus of the rec-inch

MORNING AND EVENING STARS.

- 3 MERCURY will be at Greatest Elongation (E) on July so, and is an evening star throughout the month, but sets not much more than an hour after the Sun at most, and is hardly likely to be seen.
- Q VENUS having been in Inferior conjunction on June 29, is not to be seen early in the month, but may be visible before sunrise in the latter half S E by E. Magnitude on July 31, -42.
- d MARS, moving eastward, passes about 5 degrees north of Aldebaran on July 6. It will be in the E.N. E. in the morning sky. Magnitude +2 o.
- I JUPITER will be above the horizon for a short time after sunset and may be seen north of west. Magnitude - 1'3.
- 12 SATURN being in Opposition on the 24th is above the horizon throughout the short night. Magnitude +o'3.

telescope at Mount Wilson, the heating effect of a star as faint as the thirtcenth magnitude can be measured. There is also an Electrical Resistance Thermometer which is effective because the resistance of a pure sistance Thermometer which is enective because the resistance or a pure-metal, platinum, for example, to the passage of an electric current in-creases considerably when its temperature is raised. The surface tem-perature of celestial bodies is estimated from the position in their spec-trum of the lines of greatest intensity or energy. Just as the colour of a heated iron changes with increase of heat, so the distribution of energy, which is analogous to colour, shown by the intensity of the lines in stellar meeting reader with the formers time. spectra, varies with the temperature.

An Earthquake in England. - In the early morning of June 7, 1931, an earthquake of some severity was experienced in England. No serious damage was done but the occurrence, made severity was experienced in England. No serious damage was done but the occurrence, made evident by shaking beds and swinging pictures, was sufficient to cause alarm to some, though by the great majority of the population it passed unnoticed. The shocks were felt in all parts of England from Bournemouth to Aluwick, from Candiff to Hull where the effects seem to have been most severe, and, it is said, as far west as Waterford. The fall of a chimney stack was reported from the neighbourhood of Hull as an effect of the earthquake. Besides these visible effects the earthquake was recorded by the seismegraphs at Kew, Oxford, West Bromwich, Liverpool,

Time of High Water at the undermentioned Places-

MORNING AND EVENING STARS.

MERCURY, being at Greatest Elongation, West, on Sept. 3, may be visible in the morning in the last few days of the month after 4 o'clock, a few degrees above the horizon, E. by N.

Q VENUS rises unusually early, and is at greatest brilliancy on August 5, so that the planet makes a fine display as a morning star this month. It moves eastward through the constellation Gemini. Magnitude -4'z to -4'z.

d MARS moves into the constellation Gemini. will be in the neighbourhood of, but 5 degrees nigher than, Venus throughout the month. It is much less conspicuous than that planet, being about as bright as Castor. "JUPITER, being in conjunction on the a6th, rises and sets nearly with the Sun during this month.

b SATURN is now to be considered an evening star. It will be seen between S.E. and S. at altitude about

Stonyhurst, Edinburgh, Aberdeen and Durham, and by many on the Continent. From these records it was deduced that the epicentre, or place of origin on the earth's surface (see p. 76) was in the North Sea, 50 or 60 miles east of Hull, and that the earthquake happened 25 minutes

or so miles east of Hull, and that the earthquake nappened 25 minutes and some seconds after midnight of June 6.

Notable earthquakes that have occurred in England in comparatively recent years are those in the neighbourhood of Colchester on April 28, 1824, and in Western England on December 17, 1826, and August 15, 1926, the epicentre in both cases being found to be a few miles from Herenord. This district has been the scene of earthquakes on other dates.

The Moon's Surface.—With a small telescope there will be seen on the Moon features that have been called seas (perhaps rather unfortunately), mountain ranges, craters, mys and rills. Bright rays and rills are seen beat at Full Bloon, the other classes at times near the quarter phases, and especially when near the line of demarcation between the illuminated and dark parts of the lunar surface. The most remarkable are the craters, or nearly circular formations, having for their circumference a ling of mountains which rise abruptly to heights anything between 2,000 and 20,000 feet above the surrounding country. The number and size of these—many of them being 50 or 65 miles in diameter—make the Moon's surface quite unlike that of the Earth. It has long been suggested that these are the result of volcanic action on the Moon, but if this is 0, they must be fossil formations. There is no trace of anything on the Moon that in the least resembles an expanse of water, which would be seen glittering in the sunight, nor are any striking changes that might be atmospheric seen as on the planets. We appear, in fact, to be tooking on a dead world.

MORNING AND EVENING STARS

OMERCURY is a morning star and may be seen between 4 and 5 o'clock in the early days of September north of the east point.

Q VENUS continues to be a brilliant object of the morning sky, rising before a o'clock. It will be due east at an altitude of an degrees about 4 o'clock. Magnitude - 4 to - 28

east at an arothuc or so degrees about 4 of lock. Magnitude - 40 to - 38

d MARS uses shortly after midnight. Vonus is moving towards Jupiter, and at the end of the month, in the dawn, the three planets will be in a line stretching upwards over the eastern horizon, with Regulus between Venus and Jupiter. The waning Moon passes along the line between the 25th and 25th. Magnitude + 18.

1 JUPITKE is a morning star in the following part of
Leo. Magnitude — x'3.

Leo. Magnitude - x'3.
 h SATURN, low in the south in the early evening, sets soon after midnight.

The Harvest Moon.—The Full Moon on September 14 is the Harvest Moon this year, and it will be seen that the times of moonrise on September 13, 14, 15 and 16 show differences between consecutive nights of only so minutes. This daily retardation is unusually small, as it was at Harvest Moon lest year, and at other phases in recent months, which is due to the fact that the longitude of the Ascending node of the Moon's orbit is not far from 360°. In northern latitudes, at the time of moonrise on the days about Full in September, the Moon's orbit is inclined to the horizon, but at a small angle, and the smallness is accontrated when the node is in this position. The Nodes of the Moon's orbit regress on

the Ecliptic in about 181/2 years.

Conjunction of Venus and Jupiter.—These bright planets make a special display in the morning sky this month. Since July, Venus has been moving through the constellations Gemini, Cancer and Leo towards Jupiter, which is moving less rapidly in the same direction, and overtakes it in the morning of October so. The planets will rise separated by less than 7 minutes of arc, or by rather less than a quarter of the diameter of the Moon, this distance increasing slightly before sunrise. Conjunctions of Venus and Jupiter occur almost yearly, though they may not happen when the planets are in the night sky as is the case this year. The last was on August 8, 1831, the next will be on August 17, 1932. The distance between the objects is comparatively small on this occasion, but at a conjunction on February 6, 1892, that was seen from Australia,

MORNING AND EVENING STARS.

- MERCURY will not be seen either in the morning or evening this month It sets only half an hour after the Sun at its end.
- Q VENUS continues its eastward progress and moves into Leo, being near Regulus in the morning of the 6th. Its approach to Juniter, and close conjunction with that planet on the acth (see p. 40) will be noted. Magnitude -38 to -36.
- d MARS rises shortly before midnight during the greater part of the month, and will be seen in the morning sky on the right of Regulus, to which it is equal in brightness. Magnitude + 1 3
- JUPITER will be seen between east and southeast in the morning sky. Magnitude -1'3 to -14
- h SATURN may be seen low in the south-west in the early evening. Magnitude +o7 to +o8.

	S.A	SATURN h

their edges were separated by 14 seconds of arc only, and the planets were seen as one until this had increased to about a minute and a half.

The Temperature of the Sun.—The effective temperature of the Sun, or the rate at which heat is emitted per unit area at its surface, is in the neighbourhood of 5,500° C. This is calculated from the Solar Constant, which is a measure of the heat received from the Sin outside the earth's atmosphere found from observation The Sun's temperature is also evaluated by the method mentioned on p. 29. The results are in approximate but not precise agreement.

The Leonid Meteors.—On the might of November 13 1833, and again on the same date in the year 1866, showers of meteors were seen radiating from a point in the "Sickle" of Leo in numbers that were described as "terrifying" Moderately fine showers were seen from the same radiant in 1832 and 1865. After the display in 1833 it was remembered that a similar shower had appeared in 1892 and examination of historical records resulted in finding many instances of notable meteor showers seen in November separated by intervals of multiples of 13 or 34 years. A few shooting-stars are seen from the same radiant shout this date in every year, and the inference is that there is a stream of small bodies moving in parallel paths in a long, oval orbit round the Sun that intersects the orbit of the Earth at the point where the Earth is in November. In the greater part of

MORNING AND EVENING STARS.

- ${\mbox{\sc y}}$ Mercury though at greatest elongation, east, on the ${\mbox{\sc t}}_4$ th sets less than an hour after the Sun throughout the month and will not be visible.
- Q VENUS is a morning star rising at the times shown. It will be in the south-east about half-past 6 o'clock. Magnitude -3'5.
- of MARS is a morning star It will be a degree and a half north of Regulus in the morning of the roth. Magnitude $+ x^2 x + y + y + y = 0$
- 2 JUPITER is still in company with Mars and Venus, but their relative positions have much changed. At 5 o'clock towards the end of the month Jupiter is fairly high in the south-east, with Mars rodegrees higher on its right and Venus considerably lower on its left. Magnitude r'4 to r'5.
- h SATURN sets in mid-evening nearly at the southwest point. Magnitude + o 8.

this orbit the lodies are few, but in one part they are many and stand out like the fewel in a ring, this profuse mass going round the orbit in 33½ years. A meteon c shower occurs when such an orbit intersects the earth's orbit and the stream and the earth arrive together at the point of intersection, and because a display was seen in consecutive years. 1866 and 1867, it seems that the jewel must be of some length. It was reasonably expected that the Leonid meteors would be seen in some profusion in the years 1899 and 1900, but they failed to appear Nevertheless, it is thought possible that they may visit us in some number in November of one or more of the years 1932 to 1935. The presence of the almost full Moon in the sky is likely to prevent any spectacle this year.

The Earth's Rotation.—Ephemerides are computed on the assumption that time moves uniformly, and that the length of a day, whether mean solar or uniform sidereal, is invariable, except for a small recognised secular variation. It is now believed that the rotation of the Earth, upon which the length of the day depends, is not constant. Such a change, although imperceptible from day to day, would lead to a cumulative error in time reckoning, so that the observed time sahown by the clock might differ by many seconds from the time which the compilers of the tables of the Sun, Moon and planets expected the clock to show at a given moment of absolute time, the effect of this error being revealed not as an apparent clock error, but as an apparent error in the ephemerides of the Sun, Moon and planets. It was the correlation of these apparent errors that led to the announcement of the variability of the Earth's period of rotation. (From the Mautical Almanac vaga. Explanation.)

RISING, SOUTHING, and SETTING of PLANKTS. (Noon = 12h.)

MORNING AND EVENING STARS.

MERCURY Q Venus Q Souths b. m Souths Sets h m h m m 4 7 46 11 6 34 II 53 I6 9 37 '14 35 4 39 10 55 15 16 10 29 14 53 9 43 14 16 5 0 6 5 21 9 51 14 19 10 27 14 40 5 42 9 59 14 15 MARS & JUPITER 7

5 MERCURY rises nearly two hours before the Sun in the last ten days of the month, and may then be seen at 7 o'clock about 5 degrees above the southeast horizon.

Q VENUS will be seen in the south-east before sunrise. Altitude xgo at about half-past six at the beginning of the month, but lower at that hour at the

end. Magnitude -34.

d Mars moving in the constellation Leo approaches Jupiter but does not overtake it. Its brightness increases lapidly. Magnitude +o'o to

+0'3.

I JUPITER like Mars rises before midnight, and both are conspicuous objects of the morning sky, moving eastward between Regalus and Spica. Magnitude -1'6 to -1'7.
12 SATURN is above the south-west horizon for a

short time after sunset. Magnitude +o 9.

Large Telescopes.—The Royal Observatory, Edinburgh, possesses a reflecting telescope with mirror 36 inches in diameter that was installed in the year 1930, and there is also a 3-foot reflector at Cambridge. A 11 10 43 14 57 19 10 18 10 18 14 38 18 46 25 9 58 14 7 18 22

in the year 1930, and there is also a 3-foot reflector at Cambridge. A similar instrument with mirror of the same dimension, the gift of Mr. W. J. Yapp, is being made for the Royal Observatory, Greenwich.

These will be the largest objectives in use in Great Britain. There are some larger on the Continent and in America, the largest of them now being the xee-inch mirror at the Mount Wilson Observatory, California, but a see-inch mirror is being made for use in that part of the world. A reflecting telescope, 74 inches in diameter, is part of the equipment of an observatory now being established by private munificence near Toronto.

THE TIME OF HIGH WATER at the undermentioned Ports and Places may be approximately found by taking the appropriate Time of High Water at the Standard Port (as shown on pp. 5, 9, etc.) and adding thereto the quantities annexed. The time thus found will be Greenwich Time for British, Irish, French and Belgian Ports, and Amsterdam Time for Netherlands Ports. The rise of the tide at Springs and Neaps is given in the last two columns. An* denotes Range of Tide.

Sum ...27 12

Time of high water at Aberdeen, Jamary 11th 3 12 Morn.

54 Tables for Finding the Times of Sunrise and Sunset.

THIS double entry table provides the means for finding, with sufficient accuracy for practical purposes, the times of sunrise and sunset at any place situated between latitude 60° N. and 60° S.

To use the table: In the horizontal line with the Sun's declination in the first column, and under the required latitude in the heading, there will be found figures which added to sal, give the local apparent time of sunset. Subtracting these quantities from sal, will give the local apparent time of obtain from this the local mean time, the equation of time for the day in question which is given on the second page of each month, must be added to or subtracted from these apparent times of sunuse and sunset, as shown in the heading.

To find the corresponding Greenwich mean time, the difference of longitude of the place from Greenwich must be added if the place be West, subtracted if East The table is arranged for northern latitudes, but will serve equally well for places south of the Equator, if the declination North in the first column be considered South, and vice verse.

If the figures are required for a declination or latitude falling between two arguments of the table, they may be found by proportion. The effect of refraction is included.

THE TIME OF SUNSEI.

The times of sunsise and sunset given in this Almanack (and similarly of moorries and moonset) are the times when the centre of the Sun's disc is seen on the horizon from sea-level at Greenwich, computed on the assumption that the horizontal refraction is 24%. It is doubtful whether there is a precise legal definition of sunrise and sunset. The above has generally been adopted as a correct statement, though in some Tables the instant when the upper limb, or edge,

of the Sun is on the visible horizon is given as the time when the San rises and sets. The legal question has been more concerned with laws and regulations must be taken to mean the distinction between local sunset and Greenwich sunset, rather than with a precise whether it be stated in local or Greenwich ti

TO FIND THE GREENWICH TIME OF SUNRISE AT CERTAIN PLACES IN THE BRITISH ISLES IN EACH MONTH OF THE YEAR.

The Table gives the number of minutes to be added to or subtracted from the time of sunises at Greenwich, to find the Greenwich time of sunrise at the place named in the first column, on the first day of each month. The corrections to be applied on other dates and for other places in the neighbourhood of these may be inferred approximately by interpolation.

The aign + means that the time required is later than that at Greenwich. The sign -, has it to earlier.

it is earlier.

If these Tables be considered in conjunction with a map it will be seen that the places at which the Sun rises at the same moment lie in a slightly curved line across the map, the lines for different moments being approximately perallel. The lines change their inclination to the meridian throughout the year. Similarly for the setting.

The times in the headline and penultimate column are Apparent. By applying the Equation

of Time, the Mean Time is found to which the figures are appropriate.

Alt.—This is given to tenths of a degree, but there may be small differences between the A...—Into a given to tentus of a degree, but there may be small difference between the morning and afternoon hours, and between the like days of the year. The effect of Refraction is not applied. Azimuth (Az.) is measured either eastward or westward from the N. Az. 45° is equivalent to N.E. or N.W. Az. 135° to S.E. or S.W. E.S.E. or W.S.W. is 125½°.

The year is divided into periods of thirty days (with exceptions). The figures for days other than those given can be found by interpolation with approximate accuracy.

Latitude 33° is chosen as an average for England. North or south of this the moon altitude is respectively less or greater by the difference of latitude, and for other times pro rata.

Solar and Sidereal Time.

TO FORM EQUIVALENT INTERVALS OF SOLAR AND SIDEREAL TIME.

The length of a Sidereal day is 23t. 56m. 4 29s. of Mean Time One hour of Sidereal Time is, therefore, equivalent to 59m. 50 17s. of Mean Time, and one hour of mean solar time is equivalent to 15 cm. 50 18s. of Sidereal Time. The multiples and submultiples of the differences from one hour are tabulated below under headings "acceleration" and "retardation"—for the argument (common to both) in the middle columns. If the argument be considered as Mean Time, its equivalent in Sidereal Time is obtained by adding the acceleration. If it is Sidereal Time, its equivalent in Mean Time is found by subtracting the retardation

Celestial Phenomena for Obserbation in 1932.

ECLIPSES OF THE SUN AND MOON.

In the year 1932 there will be two Eclipses of the Sun and two of the Moon. One of the Solar eclipses is Annular, and visible only from a region near the South Pole. Both the Lunar

eclipses are partial but very nearly total.

I. An Annular Eclipse of the Sun on March 7, invisible at Greenwich The path from which annularity may be seen as allort, wide are in the Southern Ocean, south-west of New Zealand, its middle point being about Lat. 62° g'. Long. 235° E. where the phase will last for 5 minutes 19 seconds. A partial eclipse will be seen about

sunset in Australia.

II. A Partial Ectipse of the Moon on March 22, invisible at Greenwich. The beginning will be visible generally from Eastern Asia, Australia, the Pacific Ocean, North America, except the north-eastern part, and from the extreme western part of South America; the ending will be visible from Asia, except the south-western part, the Pacific Ocean, and from the extreme north-western part of North America.

Moon enters umbra ... Mar azd, roh. 59m. G M.T.

Magnitude of eclipse o 973 (Moon's diam. = 1) III. A Total Eclipse of the Sun about 7 o'clock In the evening of August 21 by Greenwich time. Invisible at Greenwich. The eclipse begins north of Siberns. The track of totality, after passing near the North Pole, crosses Hudson say, Quebec Province, Vermont, New Hampshire and Maine, and ends in the Atlantic Ocean. It leaves the coast-line a little north-east of Boston. Maine, inland, near its boundary with New Hampshire, where the duration of totality the point where it leav on the central line will be about 200 seconds, lowest point to the right.

a few seconds short of the maximum, appears to be a favourable spot, both as regards position and weather prospects. From Montreal, which is just on the southern limit of the path of totality, a total eclipse will be seen lasting a fraction of a total eclipse will be G.M.T. a minute at soh. 24m. G.M.T. Long.

Central Eclipse be-D. H. M 31 19 4 in 109 16E. 79 36N. gins

Central Eclipse at local apparent

,, 19 17 ,, 109 10W. 78 36N.

At Montreal the eclipse begins at 19h. 14m. and ends at azk. 30m. G.M.T.

IV. A Partial Eclipse of the Moon in the evening of September 14. Visible at Greenwich. The beginning is visible generally from Europe, Africa, the eastern part of the Atlantic Ocean, the Indian Ocean, Asia and Australia; the ending is visible from the same regions excepting Australia and Eastern Asia, and adding the north-eastern part of North America

Moon enters penumbra Sept. 14d 18h. umbra. 20/1. 18m. ,, Middle of eclipse azh. om. ,, Moon leaves umbra 22h. 43m. •• penumbra 23h. 56m. ,, ,, penumbra... , ,, s3h. 56m. Magnitude of greatest eclipse, o'o8z (Moon's

diam.=x).

The centre of the moon will rise at Greenwich at 18h. 10m. The point of the disc that first cuters the umbra will be about 50° from its lowest point measured along its edge to the left; the point where it leaves about 50° from its

The above is a list of stars, chosen within certain limits as to magnitude and phase of the Moon, The above is a list of stars, chosen within certain limits as to magnitude and phase of the Moon, that will be occulted during the year, with the time of the phase of the occultation mentioned as seen from Greenwich. In general the phase is that which takes place at the dark limb, but the disappearance of Regulus on Nov. 2x and of ρ Leonis on Dec. 19 are both at the bright limb. The Moon is among the Pleiades on the night of January 18, in the early morning of Aug. 24 and on the night of Nov. 12. On the last occasion both phases of the occultations take place at a sensibly bright edge since the Moon is Full in the morning A the day mentioned. The "angle from N. point" shows the place of disappearance or reappearance on the Moon's edge, and is measured from the point nearest the Pole of the heavens (not the highest point) towards the east

JUPITER'S SATELLITE PHENOMENA.—The Table on p. 58 gives the Times of Disappearance (D.) and of Reappearance (R.) of the Satellites of Jupiter at Eclipse that will happen when Jupiter is above the horizon at Greenwich and the Sun below. These phenomena are seen simultaneously from above the horizon at Greenwich and the Sun below. These phenomena are seen simultaneously from all places where the planet is above the horizon at the time. From opposition to conjunction, i.e. from Feb. 7 to Aug. 26, the eclipses take place on the eastern side of the planet; from conjunction to opposition on the western. In the latter periods, i.e. from Jan. 2 to Feb. 7 and from August to December, satellites I and II disappears by eclipse and reappear from occultation at the eastern edge. The times of such reappearances (Oc. R.) are given, the satellite and the time of its disappearance being in the preceding line. From Feb. 7 to Aug. the converse happens, and the times of disappearance by occultation (Oc. D.), and of reappearance after eclipse are given, the satellite being named in the second line. Near the time of opposition this pertains to satellites III and IV as well as to I and II as will be seen by examples on Jan. 32 and Feb. 26. The eclipse of a satellite is always accompanied by its occultation which precedes the eclipse from opposition to conjunction of Jupiter, but follows it from conjunction to opposition. In the morning of Jan. 28 satellite IV will disappear by occultation at 2h. 24m. and on the night of March 21, III will be occulted at 23t. 25m., reappearing at 3t. 25m. On the evening of April 29 when II and III are simultaneously eclipsed, I will be in transit across the dir2 from 2sh. 15m. to 2h. 33m., so that for a period Jupiter will be seen with only one exterior satellite, whilst a the morning of Nov. 21 there will be none from 2.25 (see p. 21)

!

Fired Stars.

its Right Ascension and Declination, nates analogous to ongitude and latitude on the terrestrial sphere. The ines of reference on the celestial sphere depend on the position of the axis of the Earth bus since, for easons known generally by the word Precession, this position has a coninual small movement with respect to the stars, Right Ascension change clination change by an Ascension and Deamount that can be computed by formula. Observation of the stars shows that they do not con-form precisely to his computed precessional change, and the outstandng amount for inlividual stars known as Proper Motion (see page 55), is shown in two columns of the adjoining table. ession and Proper Motion combined, or the amount by which each element f a star's position changes in a year, known as the Varition is also shown The angular paral-ax of a star is the angle that the mean radius of the Earth's orbit would, placed squarely, subtend at the star, and is therefore inversely proportional to its listance, and hence s a measure of that same. The parallaxes in the adjoining table are mainly trigono-metric (see p. 64) and are taken from the General Cataingue of Parallaxes collected by Dr. Frank Schlesinger of Yale. The entry con indicates that the star is

THE objects of the sky, Sun, Moon, Planets, Stars, appear to us to be fixed on the interior surface of a hemisphere of which the observer is the centre. Actually the various classes of objects are at very different distances. The of Objects are at very direction circuits. Moon, our nearest neighbour, is 20,000 miles from us; a distance which light, travelling at the rate of 185,000 miles a second, traverses in less than a second and a half. Of the bodies of the Universe whose distance is known, the farthest is so remote that its light takes over 100,000,000 years to reach us. The nearest star to the Sun is more than eight thousand times as far from it as is the planet Neptune. It is the purpose of modern astronomy to investigate the method of distribution of these bodies in space, their movements and their sizes. Cosmical Cosmical Physics attempts to deduce their physical nature, and that of cosmical matter in general from the observations of the astronomer, combined with knowledge gained in the laboratory, with the hope of finally elucidating their past and future history. The total number of stars of magnitude 6 and brighter, which is sometimes taken as the limit of naked-eye visibility, is about 4,300, of which 3,000 are visible during the year from latitude 60°, but a more generous estimate, formed by including cases when two faint stars close to gether are seen as one, sets the whole number at 10,000. By the aid of the photographic plate objects are detected and recorded which no eye can see, even with the best optical aid, and from counts on such plates estimates have been made of the number of stars in the Universe. s,000,000,000 was once assigned as a limit to their number, but this has been much increased by various estimates. From them 50,000 millions may be taken as the possible total number of stars in the galactic system (a. in/ra), though twice that number has been mentioned as a reasoned estimate. The number in the whole of space is incalculable.

THE STRUCTURE OF THE UNIVERSE.

The stars are divided into groups according to their apparent brightness and down to the oth or roth magnitude the number of each magnitude is known, all to this order having been catalogued. For fainter stars the numbers have been derived from counts in sample areas. If the Universe is an aggregation of stars in which the individuals of each degree of intrinsic brightness are distributed uniformly throughout an endless space, it can be shown that the number of stars brighter than the 4th magnitude would be about four times as great as the number brighter than the 3rd; the number brighter than the 5th magnitude greater than the number of those brighter than the 4th in the same ratio, and so on indefinitely. When the numbers of stars of on indefinitely. When the numbers of stars of different magnitudes obtained by counts are compared it is found that this star-ratio, as it is called, in the case of the brighter stars, approaches but does not attain the theoretical value 3.98, and that the ratio decreases continually as the stars are fainter, until at the 16th and the 16th approaches the order of the property of the continually as the stars are fainter, until at the 16th approaches the only approaches the property of the continuation. magnitude it is only about two. The explanation of this observed fact is that the universe of stars accessible to vision is limited; either there are few or no stars beyond a somewhat indefinite boundary, or we are prevented from seeing them by absorbing material distributed throughout interstellar space

It is established from counts and measured distances that around our Sun the stars are fairly

per re cubic parsecs. It is obvious that a uniform distribution of this nature cannot go on indefinitely, for, if it did, the background of the firmament would be bright, since in whatever direction we looked we should, in time, come to

a star.

To a casual glance it is clear that the stars are not uniformly distributed over the sky, but have a tendency to congregate near the great belt of cloud-like forms which encircle the heavens, cioud-like forms which encircle the heavens, known as the Milky Way or Galaxy. Applying the method of sounding by "star ratios" above outlined, it is found that the stars appear to thin out less rapidly as we go out in the plane of the Milky Way than they do in the direction of the galactic poles. The deduction is apparent; the boundaries of the stellar system are more distant in the plane of the Galaxy than they are distant in the plane of the Galaxy than they are at the poles. In other words, the stellar system is an extremely flattened organisation, whose general form is, roughly, that of a double convex lens or of a watch. Looking along the galactic plane we find the stars crowding together, as we should expect, since this is the direction of we should expect, since this is the direction of greatest extension, and the Milky Way is therefore largely a depth effect. But examination of its promuent features, the great star-clouds, the irregularities in its form, and the deep rits in its structure, shows that its appearance is not wholly due to depth, and that the region is the bome of bodies and masses other than uniformly distributed stars. This aggregation is known as the Galactic System; it has been called the Stellar Universe, or the Universe, but the name is scarcely well-chosen because, as will be seen below, there are other aggregations which make this superpressed is a unity to be seen below. system merely a unit in an immense number of such denizens of space.

Statistical study of the distribution of the brighter stars shows that they form a local system that appears to have the same shape in general as the larger system spoken of, but the fundamental planes are slightly inclined one to the other. It was formerly a general belief that the Milky Waysurrounded this congregation of stars as a girdle, whether continuous with it or not was an open question, but a modern view supposes the existence of other local systems similar to this one of which our Sun is a member, all lying more or less in the Galactic plane that may be seen as star clouds in the Milky Way. The greatest con-densation of stars as we see them occurs in the bright galactic clouds in Sagittarius, while the opposite portion of the Milky Way is a region of low concentration and brilliancy, from which it is inferred that we are not at the centre of the galactic system, but that this is about so,ooo light years from the Sun and is situated in a star cloud seen in Scorpius and Sagitarius (Shapley).

In and around the Milky Way there are irregular nebulae (see p. 65) of which the nebula in Orion is one of the most remarkable that are found to be comparatively near objects, and are to be considered as within the Galaxy. There are masses of dark nebulosity that appear as rifts obscuring the stars behind. But besides these there are nebulae of another type that are not seen about our central Galactic plane, though some, it has been suggested, may be hidden by the dark nebulosity, which are thought to be very distant from our Sun, but viewed with a owerful telescope are resolved into spots of light believed to be stars. Such nebulae were called by William Herschel "Island Universes." uniformly distributed at the rate of about one | They are now more often called extra-galactic

The last columns show the light emitted compared with that by our Sun, considered to be of magnitude — s6 57 on the stellar scale. al Centauri is the brighter of two bright stars seen as one by naked eye; they have a faint companion, Provima. al, al, al, Crucis, if considered as one star (Mag 1's) would have been in the first of above lists.

* Brighter component.

nebulae, and being, to some degree, of the same shape as, and bearing other resemblance to our own galactic system, are believed to be similar own galactic system, are consecuted to be similar systems perhaps in course of making. About two unlibous of these extra-galactic nebulae are visible in the Mount Wilson zoo-inch telescope They appear to be scattered with a tolerable approach to uniformity through space, their average distance apart being something of the order of a,oo,oo light years. The most distant of them is about x40 million light-years from us.

To sum up modern ideas of the Cosmos we consider our Sun as one of millions, perhaps, that make up our local system. This, with other local systems and other bodies, make up the galactic system, which is merely one among millions of such systems that form the Universe.

Attempts have been made to estimate the mensions of this Universe of stars. Four dimensions of this Universe of stars. thousand light years was a former estimate of the diameter of our local system, but a more recent one is of the order of so,000. The larger diameter of the galaxy is estimated to be more than 200,000 light years; 140 million light years may be taken as the limit of the Universe, but this is considered by some to be much too large. STAR SPECTRA.

Most of the bright stars and many of the fainter have been examined with a spectroscope, and have been divided into classes according to their type of spectrum as indicated by the lines which cross them, the spectral types being named by the letters O, B, A, F, G, K, M, N. The stars of the first two classes, O and B, have spectra characteristic of helium and hydrogen. Planetary nebulae, some stars known as Wolf-Rayet, in whose spectrum the chief lines are bright, and the bright stars of Orion generally are in this group. Stars whose spectra range between A and F.—It is to be remarked that there is no rigorous line of division between the classes and that there are subclasses and spectra noted as

spectra broad absorption lines of hydrogen are conspicuous. In the next groups—F to G, and G to K—lines characteristic of metals appear, fine but numerous, and the stars of this class are yellow. The spectrum of our Sun falls late in the group F to G. The characteristic of the spectra of the remaining classes, M (and N), is the existence of a considerable number of flutings, and the stars are orange and red. Autares, Betelgense, and a Herculis are notable stars in sub-classes of this type. (v. supra.)

## STELLAR EVOLUTION.

The early stellar spectroscopists believed that they were investigating the chemistry of the stars and finding the material of which they are composed. It was thought that the hydrogen shown by the spectrum of Sirius would some day change into calcium, which is a leading characteristic of the solar spectrum, and hence that Sirius is in an earlier stage of development than the Sun. The modern view, based on laborathan the Nau. The mouern view, onsert on majora-tory experiments, is that the spectrum shows the radiative power or, in other words, the surface-temperature of the star, and that the hydrogen lines in the spectrum of Sirius, for instance, do not indicate an excess of that element, but, rather, that the star is at the temperature (10,000°C.) when those lines are prominent. The Sun is at a temperature of 6,000°C, which is known from the fact that light of wave-length 4800 Angstroms is most abundant in its spectrum. This type of spectrum is characteristic of iron. Formerly the theory of stellar evolution was very simple. It was believed that evolution was very simple. It was believed that stars began by being very hot and then cooled down, their spectrum changing in type until they arrived at a condition that gave a spectrum of type M and then disappeared. But about the year 1913 a hypothesis was propounded to the effect that in the beginning all stars are of Class M. That is no rigorous line of division between the classes and that there are subclasses and spectra noted as "peculiar"—are white or blue stars, and in their brightness, which contract, grow continually hotter, and pass through the successive spectral classes towards B, but only the more massive stars can generate enough heat to reach the white hot state required to produce spectra of that class; the others reach their critical density at spectral Class A, F, G, or even K. After this critical point in their contraction is reached the stars begin to fall off in temperature and in spectral classes in the reverse order until they have again become red stars of Class M. This is a deduction primarily from the fact that the red stars, or stars of type M, whose distance we know and whose actual total luminosity we can therefore deduce, divide into two classes: one of stars of great luminosity, the other of those of small. There are no known red stars intermediate in this respect. The same is true in less degree of stars of adjacent spectral type.

## THE SIZE OF THE STARS.

The surface temperature of a star or rate of emission of energy per unit area is known, by help of a certain law, from the colour of the light that is emitted most profusely as shown by its spectrum, and since the intrinsic luminosity is the total outpouring of energy, it is easy to understand that the area of the surface may be deduced, and hence the diameter of the star. Writing generally, the size of the majority of the stars estimated in this way is of the same order as that of our Sun, though some may he so times as large, others smaller in the same ratio. The bright red stars, of which there are not many, are giants having diameters soo times or more that of our Sun. There are a few stars of peculiar quality known as White Dwarfs that are much smaller, but of an amazing density and weight.

The stars are too remote for even the largest to show an appreciable disc in any telescope as do the planets, and obviously the size of a star is not proportional to its brightness as we see it, for this depends on its distance, and also on temperature or other physical condition. It is possible, as suggested above, to deduce the diameter of a star from its spectrum and apparent brightness if its distance is known, but a more direct way of measuring stellar diameters has lately been found by an instrument known as an "interferometer," with which the angular diameters of several of the largest stars have been measured. Since the distances of these stars are known, the following values of the diameters in miles have been deduced, and it is satisfactory that these agree closely with the values derived from consideration of the surface brightness as above outlined:

Betelgense (average) and , , , , Aldebaran ...... 34 , , , , Arcturus ...... 38 , , ,

## ABSOLUTE MAGNITUDE.

This phrase which is much in use in the astronomy of the present day, implies the luminosity cloud—and by adopting the of a star irrespective of its distance, to which reference has already been made. The precise

definition of absolute magnitude is that it is the number that expresses, according to the usual system of stellar magnitude, the brightness of the star as it would be if it were at the distance of no parsecs (parallax  $\circ$ n'). It is clear that if the distance of a star is known, its absolute magnitude can be computed from its apparent, or by reversing the formule, if the absolute and the apparent magnitudes are known, the distance of the star can be determined, the numerical relation between M the absolute and m the apparent magnitude, being M=m+5+5 [og  $\pi$ , where  $\pi$  is the decimal fraction indicating the parallax of the star.

#### DISTANCE OF THE STARS.

The distance of the stars from us is so immense that its determination is perhaps the most difficult problem of astronomy, and not until comparatively recent years has it been effected in any quantity and with much certainty. The direct method of determination of a star's parallax, as this quantity is called, consists in measuring the minute difference of direction of the star as seen from different points in the Earth's orbit. This is now usually done by photographing the star and its surroundings at appropriate epochs and measuring the change in relative position. A spectroscopic method of finding parallax through the absolute magnitude has been evolved. It has been found that in the spectra of stars the ratio of the intensity of certain pairs of lines is a function of the absolute magnitude of the star. In stars of great luminosity, for example, a certain Calcium line is very strong, whilst a line due to Iron is weak, but in a star which emits less total light the case is reversed. Examining and applying this principle to the spectra of stars whose distance has been found trigonometrically, a table correlating the above characteristic with the actual luminosity of a star may be inferred, and hence its distance.

The distances of some stars or groups of stars are found by indirect methods such as the following. If by any means it is possible to know howing. If by any means it is possible to know the mean parallactic movement (see Stellar Motion) of a group of stars the mean parallac or distance of this group follows from a simple computation. In other words, the space through which our Sun travels, which is about twice the diameter of the Earth's orbit in a year, is taken as the base-line with which to measure the distance of the stars. The parallaxes of some binary stars have been found by a computational method assuming a value for their mass

(hypothetical parallax)
For some distant objects a method is adopted depending on a peculiar property of a class of depending on a peculiar property of a class of stars known as "Cepheid Variables." These stars show very regular fluctuations, coming to maximum at intervals which range from a few hours to several days, and it has been found that the length of this period has a relation to the mean absolute brightness of the star. Those stars which have the longest period are the brightest, and a definite law has been evolved connecting the two elements. These Cepheid Variables are very common in globular starchisters—the peculiarity was, in fact, first suggested by a number seen in the lesser Magellanic cloud—and by adopting this law it is clear that the great distances of such objects may be known from a simple observation.

To express large distances a large unit is required. One of these is the space that light moves through in one year, which in miles is 6 followed by 12 zeros; another unit is the parsec, or the distance at which the mean radius of the Earth's orbit would subtend an angle of x" (parallax = one second). This is 3½ times the light year and is represented roughly by a followed by 13 zeros. The kiloparsec as equivalent for 1,000 parsecs and the megaparee for a million are words now in use. There is also a unit little used called the Striometer, which is equivalent to a million times the distance of the Earth from the Sun.

Within the sphere of 10 parsecs radius about the Sun as centre, there are rather more than a hundred stars whose distance has been measured. It is probable that more than that number remain to be discovered.

#### STELLAR MOTION

Many, if not all, of the so-called Fixed Stars are gradually changing their positions relative to one another, the movement of each star leing called its Proper Motion. The seven bright stars of the Great Bear would on this account have formed in prehistoric times a configuration rather different from that seen to-day Consideration of these proper motions has led to the conclusion that they are in part due to actual movement in space of the stars themselves, but in part to the movement of our own Sun, which causes an apparent motion of the star in the opposite direction, this latter being called the star's parallactic motion this way, it has been found fairly conclusively that the Sun, and with it the Earth and planets. that the sun, and with it the kaith and planets. In a moving through space with a speed of 19 5 kilometres per second towards a point on the celestial sphere not far from the bright stary Vega expeaking roughly, for there are differences in the determinations of the position of this

point. The Proper Motions of Stars of spectral type F and G are found to be much larger on type F and G are found to be much larger on the whole than those of other types, and it is therefore to be supposed that these classes are nearest to us. It has already been mentioned that our Sim is of this spectral type. By an optical principle known as Doppler's, it is possible to find from certain peculiarities of the lines in its spectrum the rate at which a star is amproaching or reseding from us. The star is approaching or receding from us. The "line of sight" or "radial" velocities of many stars have been found in this way, but the possibility that such spectral peculiarities may be due to causes other than motion is to be remembered.

## THE INTERIOR OF A STAR.

Astronomical physicists explore the interior of a star on the assumption that it is a volume of a star of the assumption that it is a volume of perfect gas whose molecules are in incessant motion, which constitutes its temperature, and whose pressure, density and temperature conform strictly to a certain relation (Boyle's Law), and on the further assumption that it has addited the strictly of the start of the strictly of the start of the strictly of the start of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the strictly of the stri justed itself to mechanical equilibrium such that the loca at any point within supplies just enough pressure to support the weight of the gas above it. They hence deduce the density and temperature at any point within a star, its mass and radiative quality or luminosity. It is believed that annihilation of its matter is the source of a star's energy, and that as a star grows older its mass lessens A relation between hass and luminosity found to hold in the case of certain stars for which these qualities are known is thought to hold generally, the more massive stars being the brighter, though a small class of stars of very high density known as "White Dwarfs," of which the best known is the companion to Sirius do not conform.

An alternative hypothesis to that of the per-

#### STAR CLUSTERS AND NEBULÆ.

Among the apparently solitary stars there are found groups of stars gathered close together, some of which may be easily separable into individuals, others that can only be separated by the most powerful telescopes, and objects that appear as unresolvable patches of light; the latter are called nebule, and were aptly described by Sir William Herschel as "shining finid." A short list of the more interesting of these various objects is given herewith.

There are nebulæ called planetary that are small, regular in outline, and show a uniform disc. Analogous to these are some which are dark in the centre called annular or ring nebuls. Beyond this the spectroscope divides the nebulæ into two great classes. The first spectroscopic observation of a nebula, made by Huggins in 1864, showed a spectrum of one bright him only, which indicated that these bodies, or at least some of them, are constituted of glowing gas. Later investigation showed that the spectras of some nebulae are continuous. The nebulae with continuous spectrum are called "white" uebulæ, in distinction to those with bright line spectra, which are "green" or gaseons. Photography has brought the means of studying the number and form of these objects in great detail and it is found that a large proportion of them are of spiral form They are the extra-galactic nebulæ already spoken of (see p 6a). The gaseous green nebulæ are in a small minority, and are generally diffused and irregular in outline and lie mostly in the Milky Way. outhle and he mostly the sharp way. Instantially way, in smaller, the so-called planetary and stellar nebula, do not markedly avoid it as do the spirals which lie in a zone of the sky, roughly at right angles to the Galaxy. Globular star at right angles to the Galaxy. Globular star clusters also lie outside the Milky Way, but irregular clusters are within its limits. There are also masses of Dark nebular in space which may be the carliest form of matter. it is not possible to measure their distances directly, several lines of argument lead to the conclusion that the spiral nebulic are very far away. The nebulic have been much studied recently as to their form and total brightness, and a system of classification has been proposed. The hypothesis is put forward that nebulæ of the same class are approximately of the same size, and hence that their relative distances may be inferred. Distance of the order of \$50,000 parsecs has been assigned to M 31 and M 33 (see Table) from observation of the Cepheid variables they comprise (see p 65), and from this their actual size has been deduced. The diameter of M 32 (the Andromeda) is about 13,000 parsecs.

### VARIABLE STARS.

Although the stars generally shine with unchanging brightness, there are some among them which are exceptions to this rule, and of these Algol, the star \$\tilde{\ell}\$ of the constellation Perseus, is the best known In general this star is of about the second magnitude, but at regular intervals of something less than \$\tilde{\ell}\$ pours it fades away to between third and fourth magnitude, remains so for about 20 minutes, and then regains its light. It is considered certain that this is due to partial eclipse by a dark companion that moves in an orbit round the bright star. The approximate times when this star will be at minimum in the months when it is suitably placed for observation are given in the table on page \$\tilde{\text{5}}\$. The position of Algol is given by R.A. \$\tilde{\text{3}}\$, 4m., Declination \$\tilde{\text{4}}\$ of \text{7} in.

placed for observation are given in one table on page 57. The position of Algol is given by R.A. 3h. 4m., Beclination 40° 4x° N. There are variable stars of types other than those like Algol. The Cephcid variables have an average period of about y days, and the rise from minimum to maximum takes only about one-third of the whole period, so that the decrease of light is more gradual than the increase. It has been suggested that this may be due to a pulsation or periodic swelling and contraction of the star. A peculiarity of these stars has been

mentioned (see page 64). Stars of the \$\beta\$ Lyre type pass from minimum to minimum in about 64% days, but are not of the same brightness at all minima, the alternate being equal. There are variable stars with periods ranging between 30 and 300 days whose difference of brightness during a light-cycle may be as great as 9 or x magnitudes. The spectra of most of these long-period variables show bright emission as well as dark absorption lines, and a periodic outflow of incandescent gases and vapours is suggested as the cause of the light variation. Mira Ceti (R.A. 2h. 26m., Declination 3' 18' S.) is the most famous of these. It will probably be at maximum in April of this year, when it will not be visible Its magnitude at maximum may be anything between a and s. and at minimum, e.o. rs. and s. and at minimum, e.o. rs.

between a and 5, and at minimum, 9 or re.

There is a group of 8 or 9 stars of a remarkable type known as the U Geminorum which for most of the time are of uniform or nearly uniform magnitude, but un'ergo periodic outbursts which generally last a few days. The majority of this group are of vith or interest in the star and the star and the magnitude at maximum, though U Geminorum itself is of the 5th, and the mean range in manuitade is about 4½. The outbursts may be said to happen every 20 or 30 days, but this period is frequently much exceeded SS Cygni is included in this group, though its variation is very erratic. Also there are a few variable stars whose characteristic is the opposite of that of the class just mentioned; they are ordinarily bright, but sometimes become faint without warning and remain so for a year or more, varying very irregularly until they again attain their normal brightness. The star R. Corone Borealis, normally of magnitude 5°c, which gives the name to this class, has been observed since the year 1843, and up to the year 1945 forty well-marked minima had been recorded, ranging between magnitudes 7 and 15 in brightness and from 2 months to 12 years in duration. A variable star with the remarkably short period of rather more than an hour and a haif has lately been discovered.

## NEW OR TEMPORARY STARS.

The phenomena known as "Novae" or "New" of the rise to maximum, so far as is known, occurs only once in their history. Generally the Nova appears in the place of a star of faint magnitude which may have blazed out into confiagration, but on the other hand the juxta-position may he merely fortuitous and the phenomenon may he the sudden visibility of a mass of dark nebulous gas which by some means has become igneous. The great brilliancy, which occurs very suddenly, is short-lived, for there follows a rapid fall, and in a few months the object emits, perhaps, x per cent. of its light, whilst in a decade it falls to rath magnitude or fainter, and in some cases shows a decided variability. About thirty bright stars of this kind visible since the time of Hipparchus 134 B.C. are on record. A list of 13 that have been seen since 1245 will be found in previous issues of this Almanack, together with an account of the changes in the spectrum that have been generally observed.

spectrum that have been generally observed.

No convincing reason for these phenomena
has yet been given. The speculation has been
put forward recently that novae are explosions
of white dwarfs, and another that a faint star
collects a covering of gaseous inter-stellar
matter.

## IDOUBLE AND BINARY STARS.

The large majority of stars when looked at through a telescope appear as single points of light of different degrees of brightness and perhaps differing slightly in colour. Some, however, are seen to consist of two points, so close together that the duplicity is shown only by telescopic examination and the measurement of the relative position of the components forms a branch of observational astronomy. This duplicity would happen if one star lay in space immediately behind the other; but there are more double stars than would accrue if this were the only reason, and it is evident that the greater number of double stars are formed by components actually near together, which, it is likely, have a gravitational connection. This idea of connection was not held in early days and Sir Wm. Herschel who, in 1779, was the first to begin their systematic observation, was careful to call these pairs Double Stars, not wishing to imply anything more than nearness, though by that date it had already been suggested that two stars seen near together were actually contiguous and formed a physical system. Twenty years later observed changes in the relative position of the components of some double stars led Herschel to adopt this idea, and he used the word Binary as the name for those known to have physical connection. It is clear that limits of distance must be set, and, in general, a separation between the components of less than about 30 seconds of arc defines a double star. As to the lower limit it is found possible with a large telescope to measure distances between two stars as small as a fifth of a second. There are in the sky rg,000 to 20,000 stars between these limits that have been measured and catalogued. The number is given vaguely for it is being added to continually, a certain private observatory in the North of England, for example, contributing a hundred or more to the list annually. \( \) Ursae Majoris (Mizai) the middle of the three stars that form the tail of the Great Bear is considered to be the first double star discovered (1650). Its components of and and 4th magnitude are separated by 15 seconds It has a sumpanion, Alcor, of the magnitude freminutes distant that can be seen separately by the naked eye, but this does not come within the companion of the come within the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the companion of the the definition. Castor and y Virginis are other bright stars that consist of two components of bright stars that consist of two components of a Cassiop, 4.o., 7.6, yellow, purple; & Hydrae, about the same brightness separated by a few 3.o., 6.o., yellow, blue; 70 Ophiuchi, 4.5, 6.o., seconds. Sirius and Procyon are very bright stars that each have a very faint star as companion, and between these types there are many inc, white, yellow.

other and various combinations of magnitude. Observations of Mizai, extending over igo years, do not show any change in the relative position of the components, but from similar measures of the other stars mentioned, it is deduced that the twin components are moving round one another in elliptic orbits. In the case of  $\gamma$ Varginis the orbit is completed in about 180 years. Other visual binaries have periods that range from 10 to 250 years, but a method (see below) other than direct visual observation reveals the existence of binary stars revolving in orbits in periods that may be a few days or only a few

## SPECTROSCOPIC BINARIES.

As mentioned on p. 65, it is possible, from certain peculiarities in a star's spectrum, to deduce the speed with which any star is advancing towards, or receding from, the earth. As a result of their motion around one another, the two components of a binary star will, in general, be respectively advancing towards, and seceding from, the earth at different rates, and when both components are bright enough, for when not components are origin to enough for their spectra to be visible, the spectrum of a binary star shows two distinct sets of lines, which oscillate about their mean position in puriod equal to the period of the star. There are many stars of this kind with components so close together that they cannot be seen as two visually, but whose orbit may be determined from observations of their spectrum. Such stars are called Spectroscopic Binaries. One recently discovered, known as Plaskett's star, B.D. 601309, has a period of 14 41 days, and is the most massive and brightest star (absolute magnitude) whose elements are known.

Colours of Double Stars.-The components of close double stars that differ little in brightness show little or no contrast in colour. The components of Castor are said to be both yellowish-silvery white and pale yellow to another. The components of o' Eridani of magnitude o's and to z are both blue. Following are some examples in the opposite sense. The stars named are all physically connected and have had their orbits computed-the magnitudes of their components are shown by the figures :-

THE Sun is one of the millions of stars that make up the Universe, and, so far as human knowledge goes, in magnitude and constitution, is not unlike the stars of the night sky. It is aurrounded by a family of smaller bodies of which our Earth is one, and the Solar system, which is only a munute detail in the structure of the Universe, is the observing station from which we look out in all directions across the great distances which separate us from the other members of the stellar system

The Solar or Planetary system consists of the Sun, with eight major planets, and minor planets or asteroids, that may be counted by thousands, circulating round it at varying distances in ovalshaped orbits A moving object discovered in the year 1930 is said to be a ninth major planet (see Pluto, p. 71) Six of the major planets have smaller bodies disculating around them, so that each forms a separate system, but all the bodies receive their light and heat from the Sun

The periodic comets which return to perihelion at regular intervals may be considered to be members of the Solar system, since they move in clongated elliptical orbits of which the Sun is at a focus It is likely that their light is reflected sunlight, since they become brighter as they approach the Sun, but also that they are partly visible by their own light

The plane of the Ecliptic in which the Earth moves round the Sun (see p 75) is used as a fundamental plane of reference. The other planets move in planes inclined but little to the plane of the Ecliptic, at varying distances from the Sun, and describe orbits in periodic times which are connected with the distances by a certain relation known as Kepler's 3rd law. The aquares of the periodic times vary as the cubes of the semi-major axes. Following are given brief notes on each of the bodies which make up the solar system, with details of their sizes, distances from their primary, and periodic times in tabular form (pp. 73, 74). The time of rotation about its axis, or the length of the day of the planet, is added when this is known.

## THE SUN.

The surface of the Sun, seen in a telescope, presents a mottled appearance formed by a darkish background on which small brilliant patches are scattered, the shape of these being such that they have been called alternatively rice-grains or willow leaves. On this surface, or annd the material forming it, black spots appear sporadically, and around them are brilliant streaks called faculae, which are conspicuous when the spots are near the edge of the Sun. Bright and dark streaks unassociated und sun. Bright and dark sticats unassociated with spots, generally called floculi, can be seen in the central parts of the disc with a spectroliciscope. There are also brilliant clouds of calcium vapour pervading the solar surface that are revealed by a device called a spectroheliograph, by which the whole of the Sun's disc may be photographed by the light of any element, and of that element only. Modern views describe the spots as columnar vortices which have a deep-seated origin far below the photosphere, and assume that a sunspot is a wast tornado in which electrified particles are rapidly whirled, as is proved by the presence of a magnetic field. The spots vary in also and number, and increase and decrease size and number, and increase and docrease somewhat uniformly in both respects, passing

through a maximum about every eleven years. They increase at a rather more rapid rate than From measures of their position they decrease on the disc and by help of the elements given on page s of each mouth the latitude and longitude (heliographic) of the spots can be computed. It is seldom that spots appear in latitudes greater than 30° from the solar equator, but about the time of spot minimum or rather earlier small spots appear in even more extreme latitudes, and during the succeeding eleven years the spot regions converge towards the solar equator (Sporers, Law of Zones), and at time of maximum the spots are largely in solar latitude is to 14 N. and S. The periodicity was first noted by Schwabe, of Dessan, in the year 1843 from a comparatively few years observations, but records of earlier years and a continuous and complete record made subsequently prove the existence of a period of average length of xxl years from maximum to maximum, though there are large variations from this mean as shown by the table below. The prominences (v. infra) also show a finetuation in their activity in a and show a internation in their activity in period of the same length, and the form of the solar corone changes with the Sun-spot cycle in a most marked way. Not only this, but there are some terrestrial occurrences that vary in like some terrestrial occurrences that vary in like phase with these solar, which seems to show convincingly a connection, or at any rate a relation, between Sun and Earth (see page 76). The Sun rotates on its axis in alout asy's days, which is shown by the movement of the spota across the visible disc, but because the Earth has moved in its orbit in that time the period of rotation with respect to the Earth, the Synodic Deprod, as it is called is self-days and a spot period, as it is called, is 27% days, and a spot may therefore be on the visible disc for 23 or 24 days. These are approximate mean values, for the Sun does not rotate as a whole solid body, and the rate of rotation is not the same in all intitudes. A formula derived from the Greenwich record of spots during the period 1878-1923 gives for the time of sidereal rotation in different latitudes :-

	đ.	h	1	đ.	ħ.
Equator	25	1	Lat 15	25	8
JAL. 50	25	3	,, 20	d. 25 25	14

These figures refer to both hemospheres of the Sun. The addition of a days gives approximately the period of rotation with respect to the

DATES OF SUN-SPOT MAXIMA AND MINIMA.

	kima.	Mini	mu.
1805 B	1870.6	1910.0	1808 · O
1816 4	1883.0	180313	1880.6
1820.0	1894.1	1833.0	rgor 6
1837 E	1906 4	1843.5	1013.1
1848 · I	1917 7	1850.0	1982.6
1860 I	1927'5	1867'2	

The maximum of which the date is generally given as 19973 was not sharply defined, but was shown by a double peak in the curve of spotted sites. There was a general decline in the spotted area in 1932. The spots were mainly small, and on some days there were pone.

When the intense light of the Sun is abut of the the interposition of the dark holy of the

by the interposition of the dark body of the Moon in a total solar celipse, appendages called prominences that are generally described as reddish coloured, but appeared white from

aeroplanes on the occasion of the eclipse of reit, June 29, are seen projecting from the Sun's edge. These consist of masses of glowing hydrogen gas arising from the chromosphere, being sometimes of remarkable shape and extending to enormous heights, and are occasionally detached from the body of the Sun. It is possible to observe these at times other than when the Sun is eclipsed. In the lower strata of the Sun's envelope are found the vapours of many metals, known by their characteristic lines shown in the spectroscope. Another appendage of the Sun outside the chromosphere, called of the sun outside the chromosphere, called the Corons, can only be seen during total eclipses. The lower portion of the corons con-sists of a pale green light containing hydrogen; the upper is a beautiful mass of silvery white light, in form of feather-like plumes, with dark spaces between, which have been traced from the Sun's edge to a distance as great as twice the Sun's diameter. The corons appears to vary in shape and extension according as the eclipse occurs at the period of maximum or minimum of Sun-spots. At the eclipses of 1929, May 9, and 1930, October 21, it was of intermediate type. Solar eclipses are total only when seen from places on which the shadow of the Moon falls, and an eclipse is seen partial from localities not far from this path of totality, because the change in the observer's position places him out of the cone which envelops both Sun and Moon. There are more solar eclipses than lunar in the proportion of four to three taking the whole earth into account; for any given station the proportion is more than reversed.

# MERCURY.

Mercury is the nearest planet to the Sun, and the smallest in the system. Because it moves in an orbit between the Sun and the Earth this planet.can never be seen far from the Sun, but is always at a short distance to the West or to the East of that body. In the former case Mercury appears as a morning star and in the latter as an evening star. The extremes of these apparent excursions are known as Greatest kiongations, and their times and the distances, measured by the angle included between the lines which join the Earth to the Sun and the planet respectively, are given in the third page of each month. The great ellipticity of the orbit of Mercury causes the amount of these Elongations to vary considerably, and they may be as small as 16° or as large as 28°. Eastern elongations, when the planet is seen as an evening star, occur at intervals of about 116 days, as do Western, and at intervals of some rise days, as no vessels, and the best opportunities of seeing the planet are before the Eastern elongations in the spring and after Western elongations in the autumn. This year Mercury is likely to be visible as an evening star in March, and in the morning in the early part of September and at the end of Recomber Mercury shows phase to the Earth December. Mercury shows phases to the Earth like the Moon in her first quarter if the elongation be in the East, and like her last quarter if in the West. (See p. 73.)

# VENUS.

Venus, which is nearly twice as far from the Sun as Mercury, its distance from the central body being rather more than two-thirds that of the Earth, is almost exactly the same size as our globe. Her apparent movement with respect to the Sun is similar to that of Mercury, except that, being farther from the Sun, and has been strengthened the nearer to the Earth than her smaller neighbour, telegraphy, is fantastic.

the angles of Elongation exceed those of Mercury, and extend to  $47^\circ$ . Writing generally, it is believed that the planets rotate on axes as does the Earth, but this is not known to be, the case for the interior planets Mercury and Venus, because of the difficulty in seeing any markings on their surfaces that may be considered permanent. Attempts to discover the rotation period of Venus have shown that it may be about 23 or 24 hours, or 24 days, or 22 days which is the period in which it completes its orbit round the Sun. With this divergence it can scarcely be said that any period is proved. A scheme, practised in America, of photographing through screens of coloured glass (see Mars below) applied to this planet leads to the suggestion of an outer covering of cirrus cloud, and markings seen on the photographs taken in ultra-violet light appear to indicate a period of rotation of 30 days. This planet will be brilliant and constitutions in the evening sky in the first half of this year, and in the morning in the latter half. Her conjunction with Jupiter on Oct. so is to be noted. (See p. 40).

Mars, the first planet whose orbit is exterior to that of the Earth, is a little larger than Mercury and considerably smaller than Venus and the Earth. Details of his distance, size, and period will be found in the table. Mars is in opposition at intervals of about two years, because it moves at a rate not greatly different from that of the Earth. It will not be in opposition in 1932, the next occasion of this kind being in 1932, March 1. Though the planet will be well situated for northern observers so far as well situated for northern observers so far as attitude is concerned, it will not be a favourable opposition as to its distance, its diameter heing only x4" as compared with x5" in x94 when it was in opposition in August. Mars, like Mercury and Vonus, exhibits phases, but in a much less degree than those planets. Its disc departs from exact circular form, or is gibbous, only to the extent of one-eighth of its diameter. The other superior leaves to the awester the very recreated to the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the superior of the supe planets are too far away to show very appreciable phase, though traces of it are sometimes to be detected in the disc of Jupiter.
Unlike Mercury and Venus, Mars exhibits many well-defined markings, which enable its

rotation period to be well ascertained. There are white spots at the poles of rotation that are white spots at the point of rotation that appear to be snow, or some material that melts, since they dwindle, or even disappear in the Martian summers. The remainder of the surface of the disc is made up of dark bluish-grey areas that were at one time thought to be water but are now regarded as regions covered with vegetation and extensive areas of ruddy or orange hue, largely in the northern hemisphere, that may be of the nature of sand or rock. These markings may be considered permanent, though they suffer small changes apparently due to cloud formation above them. Among these markings are some of such dimensions that they may be properly called "canals," but certain fine, straight markings seen by some certain line, straight markings seen by some observers, but not by others, have received this name, which is certainly unfortunate, as it has been taken to imply that they are of manual construction, but for this there is no sufficient evidence or proof. The possibility of com-nunication with Mars, which in some minds has been strengthened by the advent of wireless

A method of investigating the surfaces of the planets was evolved a few years ago by photographing through "colour filters." The light before it reaches the plate, which is of suitable sensibility, passes through a coloured screen that absorbs the component rays of certain wave-length so that one colour only affects the plate. The moon, the planets and terrestrial landscapes have been photographed in this way, and comparison of the various results has auggested an interpretation. In the case of Mars the telescopic features as described above come out very strongly in red light, but fade away as the colours approach the violet end of the spectrum except that the white polar cap increases in strength, all of which is interpreted as showing that Mars has an atmosphere of considerable depth and obscuring power, sporadically cloud-leaning, and that the white polar spot is an atmosphere on Mars has for long been a matter of discussion, and to this these experiments form a valuable contribution, though they may not supply a final answer. The two satellites of Mars, Photos and Delmos, were adopted by Asaph Hall in 1877. Their names were adopted by the discoverer on the suggestion of H. G. Madan, the science master at Eton.

## MINOR PLANETS.

Between the orbits of Mars and Jupiter there are a large number of small planets, and every year considerable additions are made to the list, a hundred and sixty-two having been found in the year 1930. At present the total is about two thousand, more than a thousand being on the "permanent" lists a fully investigated. There may still be thousands awaiting detection. The four largest, found in the early years of the 19th century, are—Ceres, 482 miles; 282 miles; Juno, 228 miles; and Vesta 32 miles in diameter. Some of them are perhaps nothing more than great masses of rook flying round the Sun.

The periodic times of their revolutions vary considerably, and an average may be taken as 2,600 days, or 4½ years. Some of the optics are very oval, and the inclination of their planes to the Ecliptic lins considerably different values. The inclination of Pallas is 35° whilst that of Juno is only 13°. One of these small bodies, Evos, approaches very near to the Earth at some oppositions, which affords a good opportunity for determining the solar parallax. An opposition of this kind occurred early in the year 1931, when the milimum distance was about 26 million miles.

# JUPITER.

The next planet in order from the Sun, Jupiter, is the largest in the system, and has a diameter eleven times that of the Earth. Its density, however, is only %th that of the latter. On viewing Jupiter through a telescope it will be seen that the disc is not circular, but its form, an oblate spheroid, is believed to be due to the rapid axial rotation, which causes a flattening at the poles and bulging outwards at the equator. The same effect is produced on all the planets in more or less degree.

Jupiter has four principal satellites about the same size as our moon, or go per cent. larger, which ware the first releastial objects discovered with the telescope, Gailleo having observed them in the year son. Simon Marius, however, claimed to be their independent discovers. It has also

five much fainter satellites which are far beyond the powers of small telescopes. One of them was discovered with the 35 inch refractor at the Lick Observatory in 1892. The remaining four, which are extremely faint, were detected by means of photography and may be regarded as among the most difficult to see of celestial objects.

among the most diment to see or ceresural objects. The characteristic surface features of Jupiter are the bright zones separated by dark belist to both of which the names Equatorial, Tropical and Temperate apply in analogy with the zones on the Earth. Examined by telescope these are found to be full of detail and markings which, though they may be atmospheric, are largely permanent but undergo changes. Of these the set known is the Great Red Spot and its surroundings situated on the southern edge of the south Equatorial Belt. There are records of an observation of a spot by Hooke in 1664 which may have been an early appearance of this; the Rev. W. B. Dawes figured, it in the form of an ellipse resting on the south equatorial belt of Jupiter on Nov. 29, 1897, and in 1898 it came under general observation. A curious bay or hollow in the above-named belt was noted by Schwash un \$23, and is still seen. The mean rotation period of this object and of the red spot near it has been found to be 94, 85m. 396.

The rate of rotation of the planet is found by

The rate of rotation of the planet is found by taking transits of spots or, in other words, by noting the exact times when markings are on the central mendian, and differences in the times given by different markings is a matter of interest. During the apparition of 1929-30 a long group of dark spots appeared at the south edge of Jupiter's North Temperate Belt, which gave the remarkably small rotation period 9h. 49/4m., which is less than that of the fast-moving Equator (see below). This is the third occasion on which rapidly-moving dark spots have been detected in that latitude of the planet, the others having been in 1880 (9h. 48m., Penning) and in 1831 (9h. 49/m., Barnard, Hough). On the other hand, an observer in the early part of 1931 found a dark hump on the 8 edge of the 8 Equatorial Belt with the shnormally long period of 9h. 59m. Apart from such unusual cases the surface of Jupiter, like the Sun, does not rotate as a whole, but individual zones of latitude appear to move at different rates. Two systems are in use for defining the positions of markings on Jupiter. In System I., which pertains to the rapidly moving Equatorial Zone of the planet, the period of rotation is taken as 9h 50m. 36 os. System II applies to the Temperate Zones, and in this the time of rotation is 9h. 53m. 45 ogs.

## SATURN.

The sixth major planet in order from the Snn is unique in appearance because of its encircling ring-system, which renders it magnificent is a spectacle and an interesting object for telescopic observation. The system consists of two bright times and an inner dusky ring through which body of the planet can be seen. A marking of the outer ring known as Encke's division is sometimes seen, but it is doubtful whether this is a real separation. The rings appear to be flat annular discs of extreme thinness, in the same plane which is included as to the plane of the Ecliptic, and it is shown that neither of them can be a coherent mass or in one piece either solid or liquid, as in that case it would be dimenticated as the countries of the real content in the case it would be dimenticated as the countries of their stability. They probably

consist of an immense number of minute bodies consist of an immense number of minute boates revolving like satellites gound the body of the planet. Belts like those on Jupiter, but of not so pronounced a character, are seen on Saturn Photographs of this planet, taken by ultra-violet light show a wide dark belt near the equator which may or may not be an extension of the dusky ring. Saturn shows a bulging at equator, the ratio of the polar to the equatorial diameter being as 33% to 15, an eccentricity of the ring with respect to the Ball has been suspected. Saturn has ten satellites, situated outside the

rings; some of the former are visible in telescopes of low power. Titan, the largest, is about one and a half times the size of our moon, whilst Iapetus is nearly the same size as our satellite.

Titan was discovered by Huyghens in 1655, Tethys, Dione, Rhea and Lapetus (see table p. 73) by J. D. Cassini towards the end of the 17th century. Sir Wm. Herschel discovered Mimas century. Sir wm. Herschel discovered animas and Enceladus in 1769, and Hyperion was observed for the first time, almost simultaneously by Bond and Lassell, in September 1848. The most distant, Phobe, which was first seen in 1898 (photographically by W. H. Pickering, moves in its orbit in retrograde direction like the two exterior satellites of Jupiter, VIII. and IX. Themis, which is called the tenth satellite, though it appears not to be the farthest from though it appears not to be the farthest from Saturu, has been observed once only since its discovery in 1900, and its reality is doubtful.

This planet, discovered by William Herschel at Bath in 1781, is only just visible to the naked eye. It will be in the evening sky in the carly months of 1932 and at the end of the year, being m opposition on October 14. In a telescop. Uranus is distinguished from the stars around by its disc, which is obvious though less than 4" by its disc, which is covious though less that, in diameter, and by the quality of its light, which is less piercing than that of the stars. The two outer and brighter of its four astellites were discovered by Wm. Herschel in 1767; the two inner by Lassell in 1851. Their names, Ariel and Umbriel, were taken from Pope's "Rape of the Lock" A hundred years ago it was thought to have six satellites, neighbouring stars having been mistaken for attendants. All four move in a plane which is inclined 82° to the plane of the ecliptic and in that plane they move retrograde, or in the opposite sense to the revolution of the planets round the Sun. If, however, the plane of their movement is regarded as inclined 98° to the plane of the ecliptic, their revolution may be considered direct. It is generally supposed that the plane in which the satellites move is that of the planet's Equator A period of rotation has been determined both by spectroscopic observation and from variations of light of the planet, the value, ro3/4 hours, being sensibly the same in the two cases.

This planet is a telescopic object of about the 8th magnitude that was discovered in September 1846, as the result of mathematical deduction from irregularities shown by the observed posi-tions of Uranus. Its single satellite, which was discovered by Lassell in October of the same year, moves in a plane inclined 35° to the plane of the Ecliptic in a retrograde direction like the

length from spectroscopic observations, which is adopted. Triton has been suggested as the name of Neptune's satellite, but is not generally used.

### PLUTO.

The late Percival Lowell, from a study of the outstanding errors of the orbit of Uranus, pre-dicted the path and mass of a planet that moves in an orbit outside that of Neptune, and in the early months of 1930 a series of plates taken and examined at the Lowell Observatory showed a moving object not far from the position it should have had to accord with Lowell's prediction, but fainter than the object Lowell hoped to find. The first orbit computed was a very eccentric ellipse with period of 3,000 years, and the idea came to many that the object was a comet. The photographic plates of many observatories were scanned in the hope of finding images in former years, and these were ing images in former years, and these were found (Uccle, 1927; Mount Wilson, 1929; Yerkes, 1921 and 1927; Königstuhl, 1914). These images have sufficed to prove that Pluto's orbit is not much more eccentric than that of Mercury. The outstanding difficulty is to make estimates of its mass and size on which we may rely. The observed errors of Neptune's orbit are said to give definite evidence of Pluto's attraction, and that its mass is comparable with that of the Earth, but on this point there is not universal agreement. It is doubtful whether a measurable disc can be seen, but from its magnitude and distance it is estimated to be at least as large as Mars, and perhaps as large as the Earth. It shows no cometary appearance in the telent shows no comeany appearance in the telescope. The period is adjusted. The distance from the Sun at aphelion is nearly so astronomical units and at perihelion so such units, so that it is just within the orbit of Neptune. The body moves in a plane unclined ay to the criptic. The orbit is said to be so smillar to that predicted by Lowell that the resemblance cannot be due to accident.

Assuming it to be a major planet, the name Pluto has been accepted by the Trustees of the Lowell Observatory. This was proposed by Miss Venetia Burney, of Oxford, aged zz, a great-niece of Mr. Madan, already mentioned (see Mars).

# THE MOON.

Neither Mercury nor Venus, so far as is known, has a satellite; the one satellite of the Earth is the Moon, which is quite familiar to us. The mean distance of the Moon from the Earth is about 239,000 miles-near enough for us to get a more complete knowledge of its surface conditions than we can of any other member of the Solar system. Only one side of the Moon is seen from the earth, but every region of the Moon is presented to the Sun in turn, and neglecting hypotheses as to the possible existence of a lunar atmosphere and its effects, it seems likely that there are rather remarkable changes of tem-perature: in the lunar day of half a month it must be heated to an extreme degree, and in the other half subjected to cold equal to that of interstellar space. Her diameter is rather more than z,z60 mlles. Her rate of motion through the firmament is z3° zo' 32" per day, which implies that she travels over a space alightly exceeding her own diameter in one hour. satellites of Uranus. A period of axial rotation is agd. rah. 44m. 3s., but individual cases may variability of its light, and another of twice that range 6 hours and more on either side of this

(see also p. 74). When seen through a telescope the surface of the Moon presents many objects of great beauty and interest. A small instrument will show the chief "seas," plains, mountain ranges, ring-plains, and crater-pits The question as to the origin of these formations, whether they may have been caused by volcanic action, or, on the other hand, by the impact of meteors, forms an interesting subject for discussion. (See p. 26.) The material of which the Moon is composed is probably the same as that

of the Earth.

When the Earth passes between the Sun and Moon, the Earth's shadow sweeps across the Moon and causes a lunar eclipse, which may be either total or partial as in the case of solar eclipses, but there is the difference that the phase of a lunar eclipse is seen the same from all places ; where the Moon is above the houzon at the time Solar eclipses can take place only at New Moon, and lunar eclipses only at Full Moon (See p. 69)
The Full Moon which occurs near the Autumnal

Equinox rises at nearly the same time, about on several consecutive evenings. Because in earlier times it was thought that this was specially ordained to facilitate the in- cations of the British Astronomical Associationgathering of the crops the phenomenon was Schorr (Jan ), Grigg-Skelleup (May), Neujmin called the Harvest Moon. The Full Moon which follows is called the Hunter's Moon

### A FEW OF THE CHIEF LUNAR FORMATIONS.

Wedge-shaped Valley of the Alps - Near the central line of disc, towards the north, a clef 83 miles long and 3½-5½ miles broad

Apennines — Au extensive mountain range some

what similar to terrestrial features to naked eye when projecting into the dar part of the disc. Length, 460 miles, lughes ammit (Huygheus) reaches 18,000 fect.

ristarchus.—A lunai crater in N.E quadrant The hightest object on the Moon. This crate is visible as a luminous spot when all the sur rounding region is involved in shadow

Mare Cusuum — A dark grey oval plain visible to maked eye near W.N.W. limb of Moon Extends also miles N. to S and 354 miles E to W. Well seen five days after new or a few days after full.

Mare Serematris — Lies S of the Moon's centrand extends over 428 miles. A nearly chemistark plain Contains a crater, Lanne, formed suspected of change. This mare is vis ble t naked eye

Clavius -- One of the finest craters on the Moor and about 142 miles in diameter. Situated o S. limb.

Tycho.—Towards S limb Has been called "th metropolitan crater of the Moon." A fin crater 54 miles in diameter and 16,600 fee deep. Central hill nearly a muc high Tych is the centre of a remarkable system of brigh rays radiating from it, and they are ver conspicuous at the time of full moon. It is region (8, limb) the Moon's surface is a studded with craters that it resembles as immense honeycomb.

# COMETS

Comets that revolve in elliptical cubits roup the Sun as focus, and return to view at period intervals, may be considered members of th Solar system. The periods that have been con formed by returns range from 3% to nearl 8e years, whilst a few other computed orbit show periods as large as a million years. Other

comets move in parabolic courses and apparently do not repeat their visits to the Sun.

Those that revolve in periods from 31/3 to 9 years are specially numerous. Their paths extend outward to the region of Jupiter's orbit, and from this circumstance they are termed Jovian comets.

Encke's comet, which returns unfailingly every

31/3 years, and was due at perihelion on June 3. 1931, was observed on June 14 and subsequently. The periodic comet Neumin, with period 27½ years, whose return was expected, was observed in September, some months after perihelion pas-Two unexpected comets were discovered during 1931 (up to Oct. 1), neither of which appears to be periodic. One was unusually bright, being observed telescopically in the morning twilight,

but did not make a spectacle for general view. An unusually large number of periodic comets are computed to return to perihelion in 1932. The list is subjoined with, in each case, the month of penthelion passage. These are to be considered as approximate only, for several of the orbits are in course of re-calculation, and more precise information will be found in the publi-

numerous as the Jovian, named respectively from the planets Saturn, Uranus and Neptune, for a reason similar to that given above Neujinin's comet that returned in roar belongs to the Saturman family, while the comet of the November meteors (Tempel) belongs to the Uraman

Another class of objects belonging to the Solai system are the meteoric streams, which give rise to occasional showers of meteors, falling stars, or fireballs, and are all the same class of object, the distinction being only one of size. They are visible in varying number on every night of the year, and are sometimes so abundant as to form striking phenomena. There is some reason for the supposition that meteor swarms are the remains of distupted comets, and that Tempel's comet, that will return to perihelion perhaps at the end of 1932, is the parent of the Leonid meteors. A considerable display occurred on October 9, 1936, and a smaller one on Oct. 9, 1937, from a radiant at 262° + 55° in Draco, which appear to have been derived from Gracolini's comet of 1900, that passed its perihelion on December 11, 1926, and has a period tions. This is regarded as showing the outer
of about 6½ years. Its next return will therelimit of our atmosphere, and its height has been

1927 I (June); Wolf's and periodic (July); fore be in 1933, and metcors of the stream may Ronelly (Aug.); Konff (Aug.), Brooks (2) (Oct.); be seen this year as they appear to be distributed Tempel 1866 I (Nov.), Faye (Bec.).

There are other families of comets, none so form a very important branch of meteoric form a very important branch of meteoric astronomy. These objects make their appearance at all times of the year, and are usually seen casually by persons not looking for meteors or acquainted with the requirements of observation in regard to the phenomena, with the result they are ofter imperfectly described, which makes computation of their real paths not practicable At 5 o'clock in the afternoon of January 17, 1931, in semi-daylight, a very bulliant the ball was seen mainly from the west of England but also from places as far east as Aldershot, which was found from the observations, of which there were many to have begun its luminous there were many to have begin its himmons flight at a point 85 miles above Pontypool and to have ended it zx miles above a point in the Atlantic Ocean 46 miles west of Trevose Head, Cornwall, having traversed 168 miles at the rate of zr miles a second. If it was not already vaporised it would have fallen into the ocean 62 miles west of St Just
THE AURORA BOREALIS.

This phenomenon may be considered more terrestrial than celestral. It sometimes happens that an unusual luminosity is seen in the northern sky in the form of streamers, arches, and condensa-tions. This is regarded as showing the outer

graphs taken from two or more stations so to 60 miles apart. It is found that very few aurora are below 50 miles high, and above that level; places distant from towns and cities where the the number increases rapidly, the most frequent height being at about 63 and 66 miles. Above 66 miles the number gradually diminishes, but lights. At such places in northern latitudes some have been measured as high as 400 miles. discharge caused by charged particles shot into the earth's atmosphere from the Sun. An auroral display generally happens about the time of the occurrence of a terrestial magnetic storm (see p. 76) There is some evidence of a tendency for a display to be repeated after an interval of 29 disp, which is the period of rotation of the Sun with respect to the earth, and they are more frequent at times of sun-spot maximum. A prominent line in the green in the spectrum of the aurora has given rise to much study and has lately been shown by laboratory experiment ' to be due to a mixture of oxygen and helium, bombarded by high-speed electrified particles, but as this line has been found to be present in the light from the night-sky in non-polar regions

It is suggested that the aurora is due to electrical | faint light stretching up slantingly from the discharge caused by charged particles shot nut | Sun before sunrise in the autumn months and after sunset in Spring. From high elevations in the tropics it may be seen throughout the year. A distinction is sometimes made between thus and the Zodiacal Band which is an even this and the Zodiacal Band which is an ever fainter phenomenon and a prolongation of the Zodiacal Light. This is said to extend entirely across the sky, forming a complete ring, and there is at the point exactly opposite to the Sun a patch, a few degrees in diameter, of slightly brighter luminosity called the "Gegen-schein" or "counter glow." The Zodiacal Light has been said to be a mere atmospheric effect, but this is inconsistent with some of the chief features of its appearance. It may be the chief features of its appearance. It may be the manifestation of a widely scattered appendage when no aurors is visible it may be that this line of the Sun or sunlight reflected from a vast is not directly connected with the phenomenon. concourse of meteoric systems.

Length of Month New Moon to New 29 12 44 28 (Mean Values)

Duration of Light and Darkness.—The second column of the first page of Calendar for every month contains a small diagram showing the amount of Darkness, or the period of moonlight and sunlight during the twelve hours from 184, to 64. These small diagrams have four divisions, each representing three hours, and a division is left unblacked if the moon or the sun is above the horizon for at least half of the period it represents. The diagrams for the greater part of the year

zstoaz zstoa4 zsto3 zsto6: which reduce to in the summer.

THE shape of our Earth is that of an oblate spheroid, or a solid of revolution whose meridian sections are ellipses not differing much from sections are empses not differing intent roots circles, whilst the sections at right angles to these are circles. The length of the Polar axis, according to a recently accepted determination (Haylord) is 7,900 o miles and the diameter of the Equatorial circle 7,905 y miles. The suggestion has been made that the Equator is not an exact circle, but the supposed deviation from circularity was small, and the fact has not been proved. The mean density of the Earth is 5.5 times that of water. The Earth moves round the Sun in a plane which passes through the Sun's centre, or, to write with more precision, Sans centre, or, to write what more precision, the centre of gravity of the Earth and Moon moves in this plane, and both revolve round the centre of gravity but not precisely in the plane. The plane is called the plane of the Relptic. The Earth's Equator is inclined to this plane at an angle of 231/20, and it is this tilt which causes the seasons. At some time of the year the Sun is high above the Equator in mid-latitudes both north and south, and not only does the high attitude make the days longer, but the Sun's rays fall nore directly on the Earth's surface and make it hotter The periods of Summer and Winter are opposed in the two hemispheres, the time of Summer in the Northern coinciding with Winter in the Southern, and rice versa. Since the axis of the Earth is inclined always in the same Since the direction, the line of intersection of the Equator with the Ecliptic moves parallel to itself as the Eath travels round the Sun (approximately). The instants when this line passes through the Sun are called the Equinoles The Sun and Earth are surrounded on all sides by the stars, and because the Earth moves round the Sun. the latter changes its position with tespect the latter changes its position with tespect to the stars during the year, and different sets of stars are seen in the sky at midnight in Summer and Winter. The average velocity of the Earth in its orbit is x81/x miles a second, and it moves more slowly in July than in January. It makes a complete rotation on its axis in about 23 hours 56 minutes of mean time, which is the sidereal day. Because of the movement of the Earth in its orbit the length of the solar day is pp. 57, 77). It has been shown almost cou-clusively in recent years that the axis of rotation is not a fixed line in the Earth, but that its extremity, or the North Pole of the Earth, moves in a curve, roughly spiral, about the pole of figure as centre at a distance of a few feet from it.

# THE TIDES.

The Tides of the Ocean are rightly attributed to the attractive influence of the Moon on the Oceans, modified by a similar influence of the Sun, which is less in amount because of the much greater distance of the attracting body. If the Earth were a globe uniformly covered with water it would be possible to account for the observed phenomena and predict them by simple mathematical consideration of these attractive influences, but these are very greatly modified by this land formations of our globe, and the prediction of the tides for any port depends mainly on the results of observation. A series of observed times and heights of the tide having been complied and analysed, the analysis will show that the complete tidel movement can be represented by the combination of a

series of periodic terms, and if these terms are each carried forward to some future date their recombination will give the predicted tide. Taking the mean sea-level as datum, writing generally, at any place high water occurs twice in every 24 hours, the interval between successive happenings being 12 hrs. 25 mins. High water is at its highest (springs) at or near New and Full Moon, whilst low water falls an equal amount below at those times. At or near the time of the first and leat quarters of the Moon (neaps) the high water rises only about half as much above the mean level as it does at springs, and the low water falls about half as little below it. These phenomena do not usually coincide exactly with the times of these plusses of the Moon, but occur later, the interval being known as the age of the time at the interval being known as the age of the time. The interval being known as the age of the the—thus, at London Bridge, the highest or spring tide occurs 2% days after New or Full Moon, and the neap tide is similarly delayed. The difference of height of spring and neap tides is the most apparent of the periodic differences which make up the whole tidal variation. Besides thus there are differences due to the varying distance of the Moon from the Earth, and when the Moon is at or near perigee at New or Full the tide is specially high. There, is a slight difference in the heights of the spring tide at New and Full Moon, and also in the leight of the neap tide at the respective quarters, but these and other small periodicities are not appreciably noticeable at some ports. The mean level of the sea remains practically constant, but small changes have been detected which may be assigned to various causes.

# TERRESTRIAL MAGNETISM.

The best known manifestation of this phenomeuon is its effect on the needle of a mariner's compass, which, except for the variations to be immediately described, points continually northward. The north point indicated by a compass needle is not, except in particular cases, the north point shown by astronomical observations; in other words, the needle does not point to the North Pole of the axis of rotation of the Earth, but makes an angle with the terrestrial meridian. This angle is called the Magnetic Variation, or, more generally, Magnetic Declination, and differs in different parts of the world and even over limited tracts of country. Lines of equal mag-netic declination run across the British Hales in directions approximately parallel to that of a line from Land's End to Edinburgh. Along a line joining Cambridge to Littlehampton, the into joining Campriage to Littlenampton, the declination (West) is, approximately, the same as at Abinger. At Dover it is now rather more than a degree less; from Newcastle to Plymonth it is nearly 1½° greater, and along a slightly curved line from Killarney to the island of Lewis the west declination is 5° greater than at Abinger. There are two points of convergence on the globe known as the Magnetic Pulse. At these points a feel in averagide mer. Poles. At these points a freely suspended magnetic needle would stand vertically. The evidence available shows little, if any, recent movement of the North Magnetac Pole, whose position inferred from the Admiralty Chart of equal declination of 1,297 is lat. 27, long. 96 W., which is almost the same as found by Ross in 182z. There is some suggestion of eastward movement of the South Magnetic Pole, whose position in 1927 was lat. 73° S., long. 158° E. A scientific exploration of polar regions is being made this year, which may supply information on this point. The magnetic declination at any. place changes gradually year by year. That the compass needle does not in general point true north and south, but that it is inclined a certain amount east or west, and that the amount varies with the locality, was recognised among western nations by the end of the 15th century, Columbus being credited with the discovery. The Dip or hielination to the horizon was first noticed by Hartmann, of Nuremberg, in 1544, and was measured by Norman, of London, in 1576. That there is a continual change in the magnetic declination was discovered by Gellibrand in 1634.

# Magnetic Declination at London.

CET			
580	 11	15	East.
664	 3	30	West.
764	20	٠,	West
	 24	٥	West

In 1819 the westerly declination at Greenwich was about s4° s5', which was probably its maximum. The needle has been since moving slowly eastward at that place, and in the year sons the declination (mean) was observed to be 13° 10'0' West 'The work of recording earth-magnetism was then transferred from the Royal Observatory, Greenwich, to Abinger near Dorking in Surrey. The values of the elements there found in successive years are given in the following table :--

Year	Dec	нг	V F.	Dip
1985 1927 1989 1930 1931 1932	13 ss 7 W 12 58 4 12 58 8 12 24 6 12 13 5 18 8 5 W.	*1860 *18575 *18555 18541 18530	'42946 '42932 '42924 '42930	66 35 I 66 36 2 66 37 2 66 38 2 66 39 3

The values for 1932 are to be taken as provisional, and the declination given for 1932 inferred only. V.F. signifies vertical force.

The mean differences, Abinger minua Greenwich, for Dec. H.F. and Dip. are found to be-

The daily movement in declination of the needle at Abinger is a or 3 per cent. less in amount than that at Greenwich

The declination varies during the 24 hours, for the needle makes a small excursion in the morning from East to West, and returns, the range at Greenwich being about 12 m summer and y in winter. The needle occupies its mean position in the morning about row, and again about row, throughout the year. It reaches its most westerly position about zeh., and its most easterly position during the night or early morning at a time which varies during the year. The inclination or dip also varies in a similar manner to the declination. Since these changes of the magnetic elements are greater during the hours of daylight than in the night, are much greater in summer than in winter, and are evidently affected by changes in the solar activity—for the daily range is larger at times of Sun-spot maximum than at minimum—it is to be concluded that they are dependent on solar radiation.

# MAGNETIC STORMS.

three elements sometimes make sudden and violent oscillations which may continue for several hours. Such an occurrence is known as a Magnetic Storm, and is accompanied by spontaneous electric earth-currents, which may, if violent, interfere with telegraph working, and is often synchronous with a manifestation of the Aurora Borealia. A suspected recurrence of magnetic storms after an interval of my days that would support the theory that they are caused by radial emanations from the Sun, which strike the Earth—the hose-pipe theory has been further investigated. It appears that this recurrence does not obtain in the case of the most intense storms, but that there is a tendency for a storm of minor degree to be followed by another of its kind after the period named, which is not easily explained. There is frequently, but not always, a large spot on the Sun contemporaneously with a large storm, leading to the hypothesis of active areas on the Sun that may or may not be marked by a spot.

## EARTHQUAKES.

Earthquakes, or earth tremors, are believed to be due to some form of fracture caused by the breakage of the Earth's substance under by the breakage of the Earth's substance under a growing strain, when the strain has passed the breaking point. This gives rise to waves which are propagated through the solid sub-stance to distant parts of the Earth, and verti-cally upwards to the surface, sometimes with disastrous effects. The point where the fracture occurs and the earthquake oliginates is called the samme centre, or origin, or focus. That part seesinc centre, or origin, or focus. That part of the Earth which is vertically above this centre is called the epicentre. The waves transmitted through the Earth may come to the surface hundreds, or even thousands, of miles from the epicentre, and the times of arrival are recorded. The first indications on the seismograph are made by longitudinal waves (P), which are followed after an interval by direct transverse waves (S) in approximately the same path, but which travel at a different rate. From the length of the interval of time between the arrival of the (P) and the (S) waves, the distance of the epicentre from the recording station may be inferred, and from three or more such distances it is possible to make an estimate of the position of the epicentre on the Earth's surface (see p. 33). There is no very certain method for determining the depth of the focus, but it seems that this may range from 50 to 450 km.

# BRIGHTNESS OF THE NIGHT-SKY.

A research now in progress, not to be named as meteorological, though it deals with the surrounding of the earth, has for its first aim the determination of the amount of light in the background of the night-sky, apart from clouds or moonlight. The facts make it clear that this feeble illumination is not due to the collective light of telescopic stars, but suggesta permanent visible layer in the upper atmosphere... Observations organised by Lord Rayleigh are being made in various parts of the world of the intensity of the light separated to show the blue, green and red components (see p. 74). Observations made under this scheme at the Cape MAGNETIC STORMS.

Besides these diurnal movements and their variations that may be periodic, and a correlaperiodic variations, the magnets recording the tion with sunspot activity is suspected.

Greenwich Mean Time.

APART from abstract and philosophical considerations, Time, in actual practice, is measured by the rotation of the Earth, and a solar day is the duration of a complete rotation of our sphere round its axis with respect to the Sun, which is rather longer than a rotation with respect to the stars because of the movement of the Earth round the Sun, which is not constant because of the ellipticity of the orbit. The length of the Solar day also varies because the axis about which the Earth rotates is not perpendicular to the plane of its orbit. Clocks are adjusted to an average or mean solar day which is of uniform length and is divided into 24 equal hours. This is the basis of Mean Solar Time. The length of the Mean Solar day is constant, but that of the apparent, or the interval from one transit of the Sun across the meridian to the next, varies for the reasons above given, and it happens that the longest apparent solar day is about December as, and the shortest about September x6.

A unit and method of measurement having been established, it is necessary to choose a zero. The zero adopted is the instant when a fictitious body known as the Mean Sun, which is some-times before, sometimes behind the real Sun, is on some chosen meridian. The time is called the Local Mean Time of any place through which that meridian passes. Usually some which that meridian passes. standard meridian, such as that of Greenwich, is chosen, and the time of that meridian is used throughout a whole country, and hence the expression Greenwich Mean Solar Time, or, more usually, Greenwich Mean Time, arises (see Zone Standard Time, p. 78).

Apparent Solar Time.

The time shown by a sundial is called Apparent Solar Time, and is affected by the two causes mentioned, which make the length of a solar day not uniform. It differs from Mean Solar Time by the Equation of Time which is given in the second column of page 2 for each mouth, with a precept for its use.

The Astronomical Day.

For purposes of Astronomy the day formerly began at noon, and the hours following noon were unmbered successively from e to a. A change was made in 1985, and the Astronomical Day now begins at midnight, the hours being numbered in this way as has been the practice in this Almanack since rost. (See Note, p. 4.)

Rhathmic Time Signals.

For the purpose of comparing the time shown by a distant clock with that of the Greenwich standard, signals issuing primarily from Green-wich are broadcast from the Post Office Wireless Station at Rugby each day at roh. and 18h. For accurate comparison a series of signals of the rhythmic, scientific, or Vernier type is sent. The zero signal is exactly synchronous with a beat of the standard clock, and those that follow are at testervals of 6e/6z seconds. The comparison is made by noting the coincidence of a beat out the distant clock, beating seconds, with a signal. If a tick of the clock coincides with the zero signal, it is clear that the clocks differ by an integral number of seconds. If, however, ceincidence does not come at the zero signal, but at the sth following, the difference of the clocks contains a fraction of a second involving n/6x.

Sidereal Time. A sidereal day is the duration of a complete rotation of the Earth round its axis with referrotation of the Earth round its axis with refer-ence to the stars and begins at any place when the this arrangement will not be followed this year.

First Point of Aries is on that meridian. observatory practice time is measured, and the standard clock is regulated; by this rotation of the Earth with respect to the stars, and Mean Solar Time is derived from Sidereal Time by computation. The error and rate of the sidereal clock are found by observing the instant it shows when certain stars, known as Clock Stars. cross the meridian, and comparison of this with the known time of transit (star's R.A.) will give the error of the Sidereal clock, and from this the error of the Mean Soiar clock can be found by comparison and computation as below

The tule for finding the Mean Time of transit of any object from its Right Ascension, or, what is the same thing, of converting Sidereal into Mean Time may be stated thus .- From the given Right Ascension or Sidereal Time subtract the Sidered Time at the presenting Noon, and further dimensish the result at the rate of 10 secs. per hour, or by the Table on p. 57. If the R.A. should be smaller than the S.T. at noon, 246. must be added. The final result will be the mean time reckoned from noon, to which 12/1, must be added to convert into G C.T. as now used.

## Summer Tune.

In 1916 an Act dated May 17 ordained that during a defined period of that year the legal time forgeneral purposes in Great Britain should be one hour in advance of Greenwich Mean Time. An Act of 1922 (July 20), specified that the period should begin at 2 o'clock (4. M.T. in the morning of the day following the third Saturday in April, or if that day is Easter-Day, the day following the second Saturday, and should end at so clock G.M.T. in the morning of the day next following the third Saturday in The Act, renewed in 1924 and September, 1935, was made permanent (August 7, 1935) and modified by substituting the first Naturday in October for third Saturday in September. The Act applies to Great Britain, Northern Ireland, the Channel Islands, and the Isle of Man. hat of the periods in each year during which Summer Time has been used since its adoption will be found in this Almanack for zeef.

In the last few years Summer Time has been in use in France and Belgium during the same In the year 1850 it was enacted by statute that the word "time," when it occurred in any legal document relating to Great Britain, was to be interpreted, unless otherwise specifically stated, as the Mean Time of the Greenwich meridian." Other nations similarly used the time of their own capital, but since the year 1883 the system of Standard Time by Zones has been gradually accepted, and now almost throughout the world a Standard Time which differs from that of Greenwich by an integral number of hours, either fast or slow, is used. In a few cases the difference includes a half hour.

The Standard Time adopted in various countries is given below. In the United States and Canada five standard times are used, these large territories being divided into zones approximately 71% on either side of five central approximately 7.5% on efficient side of the central meridians. Brazil is divided into three zones in which the times 3, 4, and 5 hours slow on Greenwich are standard respectively. For the North coast of Siberia the hourly zones from xs. hours to 4 hours fast have been adopted.

In the l'onga or Friendly Islands the time rah. son fast on Greenwich is used: the longitude is about rit. som W., but the late line (see below) passes to the East of them. The time of Aden ah. 59m. 54s fast on Greenwich is standard in Aden and British Somaliland. The time of Talentia is 5/1 spin so is. fast; Holland, ch. xpm. 32'xs. fast; British Gunana, 3h. 45/m. slow.

The time s hours fast on Greenwich is called

East-European, that a hour fast, Mid-European. The time 4 hours slow on Greenwich has been called Maritime, Inter-Colonial, or Atlantic Time. The names of the other zones of North

America are as shown.

# THE DATE OR CALENDAR LINE.

The line where the change of date occurs as adopted by the British Admiralty is a modification of the 180th meridian, and is drawn so sa to include islands of any one group on the same side of the line, or for political reasons. The line is indicated by joining up the following eight points .-

(a) Lat 60° S. long. 186°.

(a) ,, 51½° S., long. 186°.

(3) , 45½° S. long. 273½° W.

(4) ,, 15½° S. long. 273½° W.

(5) ,, 5° S. long. 186°.

(6) ,, 48° N. long. 186°.

(7) ,, 52½° N. long. 180°.

(8) ,, 65° N., long. 180° W.

Then through the centre of Bering Strait to a point lat. 90 N., long, 280.

THE AGE OF THE EARTH.

In the view of science, any date for the "Creation of the World," such as the year 4004 B.C., as adopted by Archibishop Usaher from scriptural chronology, is quite untenable. From the assump-tion that its heat is sustained solely by contraction of its bulk, Lord Kelvin deduced so,000.000 years as the time that the Sun has existed, but this is too short to be accepted by geologists whose researches require a considerably longer time for the formation of terrestrial strata.
The age of the Earth has been deduced astronomically from the eccentricity of Mercury's orbit, and from the tidal theory of the origin of the Moon. Geologically by various methods, and, since the discovery of radio-activity, from active elements in rocks in the Earth's surface. which are held to result from the transmutation of uraninm. All the evidence is more or less consistent with the conclusion that the Earth has existed as a planet for a period between 1,500 and 3,000 million years.

GEOLOGICAL PERIODS.

I. AZOIO("Without Life"), containing no trace of life in any form. The duration of this period probably far exceeded that of all the remaining divisions together.

I. Express of Datum of Life", the properties of by

the remaining divisions together.

II. Econic ("Dawn of Life"), characterized by the first appearance of animal life.

III. PALEOZOIC ("Old Life") or PRIMARY, containing traces of extinct animal life:—

i. Cambrian, exemplified in Wales (Cambria), Cumberland, etc. — the earliest group which possesses a connected suite of

ii. Ordovician, exemplified in North Wales and named after the ancient British tribe

(Ordovices) inhabiting the region.
iii. Silurian, named after the ancient British inhabitants (Silures) of S E. Wales.

iv. Devoman or Old Red Sandstone, from the prevalence of the system as a marine formation in Devonshire.

v. Carboniferous, including Coal Measures, Millstone Grit and Mountain Limestone.

vi. Permian, from the Russian province of Perm, where these strata are widespread. IV. MESOZOIC ("Middle Life") or SECONDARY,

with intermediate forms of animal life :i. Trassic, from the three (tri-) divisions of

the type formation in Germany in Jurassic, typically displayed in the Jura

Mountains. in Cretaceous, from the chalky nature of its representatives where first studied.

V. ('AINOZOIC ("New Life") or TERTIARY, con-

taining forms of existing life :

i Eccene, the dawn or beginning of new forms of life, i.e., existing species.

ii Oligocene, containing a few still existing

species.

iii. Miocene, containing a minority of existing species—less than so per cent.

iv. Placene, the fossil remains show a majority

of still existing species.
VI. QUATERNARY ("Fourth in Order") or Post-

TERTIARY :i. Pleistocene or Glacial, the greatest number of the remains are those of still existing species. Period of last Great Ice Age.

ii. Recent or Post-Glacial.

Definite dates cannot be assigned to most periods, but G. de Geer has shown that scarcely 9,000 years ago the site of Stockholm was beneath

the ice-sheet (VI. i.). Traces of human life are first found in V. iv. (See also below.)

THE ANTIQUITY OF MAN.

Pithecanthropos erectus (Erect Ape-man).— Remains of a skull and of a thigh bone were found in 1892 and 1892 by Professor Dubois, at Trinil, Java. These are held to be remains of Trinil, Java. These are held to be remains of a creature of Pleistocene times (see Geological Period, col. i.), about midway between the Orangutan and Man in development.

Sinanthropos pekmensis (Peking Man).—A skull found at Choukoutien, 40 miles S.W. of Peking, China (Dec. a, 1989 (is ascribed to the same period as the Java type, but the brain development is greater than the Trinil skull and the brain case much thinner than that of the

Piltdown skull.

Australopithecus Africanus (Erect Man-ape). A skull was discovered in a limestone deposit at A skull was discovered in a linestone deposit at Taungs (Western Cape Colony), in 1925, by Professors Dart and Young of Witwatersrand University. In connexion with this discovery, Sir A. Keith, F.R.S., has declared that traces of human life may yet be discovered in Miscoustines (see col. i. V., iii.).

Homo Heidelbergensis (The Heidelberg Man).—A lower jaw was discovered near Maner, Heidelberg, in 1920. This is held to be that of a primitive man of the Pleistocene Period.

The Pilidens (Skull Co authurous of Primitive

The Pittdown Skull (Eo authropos, or Primitive Man).—Discovered in 1912 at Piltdown, Sussex, and ascribed to primitive man of carly Paleo-

lithic times.

Neanderthal Man - Remains of a skull and parts of a skeleton found in 1859 in the Neanderthal Ravine, near Dusseldorf, Rhenish Prussia. and others found at Myn, Belguun, in 1884, are held to represent the oldest known doirchoephalic (long-headed) race in Europe, living about 50,000 years before the Christian Era. In 1925 a similar skull was found near Tabgha, Palestine.

Homo Primigenius.—Discoveries of interred human remains at Combe Capelle, Dordogne, France (1905), at Brux and Brunn, Moravia, and at Galley Hill, Northileet, Kent (1895) are held to be those of human beings of late Paleolithic times, from 35,000 to 15,000 B C STAGES OF CIVILIZATION.

The terms employed by ethnologists refer to periods, not of time, but of culture, and are of local application only, there being no universal synchronous sequence in all parts of the world, Races of Europe, Asia and America had reached the Iron Age of development long before the 18th century, A.D., while laces in Oceania were still in the Paleolithic (or at least Neolithic)

stage at the time of Cook's voyages.

The Stone Age.—The ancestors of primitive man are held to have adopted the use of a suitable size for defence, while primitive man made such instruments more effective by sharpening them to a rough point. The earliest period is known as Eolithic (or Dawn of the Stone Age), and this period may have extended to 600,000 years BC Weapons of a later period, known as Palcolithic (or Old Stone Age), show gradual developments, from the chipped, leaf-shape forms, known as Chellean (from Chelles, Seine et Marne, France). and employed, perhaps, from 400,000 to 200,000 B.C., to later and more effective fint points, arrow heads and spear-heads, flat on one side, known as Mousterian (from Le Moustier, where many such implements and other remains were

found). The Mousterian period is held to have lasted until about zo,000 B.C., when Nechthic (or New Stone Age) weapons, polished and less orudely fashioned, were blought into use for a further period of about 5,000 years. In the Stone Age the burial of the dead was influenced by the primitive nature of the implements available for digging, the graves being only large enough to contain a body huddled together in a cramped position.

Cultivation of the Soil.—Cultivation is believed to have followed the interment of the dead about zo,ooo B.C., and rendered possible the political (polis = city) organisation of mankind There appears to have been a definite centre of Western Civilization at Nappur (and elsewhere in Iraq) no later than 6,000 BC, and in Egypt, under the first of the Pharachs (Menes), about 5,000 BC. It is not yet known if a similar degree of Eastern civilization had been reached in China, or elsewhere, during (or before) that of

Iraq and Egypt.

The Brunze Age —Intercommunication of races introduced a knowledge of the malleable properties of copper, while the spread of commerce distributed tin from Saxony and Cornwall among the races of Europe and Asia Implements and utensils of cast bronze superseded those of stone, wood, horn or bone The designs and decorations suggest that this stage of culture was introduced into Europe from Asia, and it must therefore be dated for the East far earlier than for the West, over a period ranging from 5,000 to 2,000 B.C. The Bronze Age appears to have been marked by the cremation of human remains, in place of mere burial in a constricted position

The Iron Age. - Implements of cast bronze were in turn superseded by those of hammered iron at varying dates—in China, Chaldaea, Assyria and Egypt about 4000 BC; in South-Eastern Europe about 2000 B.C., spreading over the rest of Europe from 2000 B.C. to 200 A.D., by which time the use of haumiered from was known throughout Scandinavia and in Ireland It is possible that the Eastern civilization discarded the use of bronze and adopted that of iron even before the West had reached the Bronze Age, and while the remoter parts were still in the Palaeolithic Age. With the Iron Age was reintroduced interment of human remains, in place of Bronze Age cremation, but the hories were laid at full length in the ground and not huddled up as in the Stone Age.

# EPOCHS AND CALENDARS

Almssiman - The Ethiopians have a chronological system which starts from the first day of the reign of the Roman Emperor Diocletian and proceeds in cycles of 532 years, the numeration beginning again on the completion of a cycle The first year began on 19th August, 184 A.D. (See also "Coptue," post)

Armenian.—The Armeniansmarked their seces-

Armenian.—The Armeniansmaiked their secession from the Greek Church by adopting it as their epoch. This corresponds to 9th July, 552 A.D. Babylonians—In the eighth century B.O. the Babylonians began a chronology with the era of the accession of the founder of their Empire, Nabonassar, 26th February, 747 B C Biblical.—The Christians of Western Europe

made many calculations concerning the date of the Greatien the State of the Greation of the World, based upon the genealogical tables in the Old Testament. In the Indian Peninsula. The principal religious seventeenth century (1650) James Ussher, Archsystems of chronology were those of the Bud-

bishop of Armagh, published his Annales Veteris Testamenti, and Useher's Notation was afterwards printed in marginal notes to the Authorised Version of the English Bible. Ussher's Notation placed the Creation of the World in 4004 B.C.

Christian. - In the chronological system known as the Christian, now in use, the years are dis-tinguished by cardinal numbers before or after Eliguished by cardinal numbers before or after the Incarnation, the period being denoted by the letters n.c. (Before Christ) or, more rarely, A.C. (Ante Christium), and A.D. (Annue Domini), the conventional abbreviation A.D. signifying Anno Domini, "in the year of the Lord." The correlative dates of the epoch are the 4th year of the roath Olympiad, the 7531d year from the Foundation of Bome, 3765 A.M. (Jewish Chronology), and the 474th year of the Julian Period. This was introduced into Italy in the sixth century, and though first used in France in the seventh it was not universally established there until about the eighth century. It has been until about the eighth century. It has been said that the system was introduced into England by St. Augustine (A. 1. 595), but was probably not generally used until some centures later. It was ordered to be used by the Bishops at the Council of Chelsea, A.D. 816. The actual date of the birth of Christ is uncertain December 25, B.C. 4, and other dates have been assigned.

Coptic.-In the Coptic Calendar, which is used by part of the population of Egypt and Ethiopia, the year is made up of za months of 30 days each, followed, in general, by 5 complementary days Every fourth year is an Intercalary or Leap-year. and in these years three are 6 complementary days. The Intercalary year of the Coptic Calendar immediately precedes the Leap-year of the Julian Calendar. The Era is that of Diodethan or the Martyrs, the origin of which is fixed at A.D. 284, August 29 (Julian date) A Coptic Calendar for the year 1648 and part of 1649 is appended :-

Year 1648. AD. 1931. Year 1648. A.D 1932. Tüt ...... Sept. zz | Bünah ... . June Babah .....Oct. Hatur ... Nov. Abib ..... July Masri .. Aug 12 11 August 7 Complement. Kihak ... ....Dec. Oct. .Sept Barmûdah ..April Hatur ......Nov. 9 | Hatur ..... 9 | Kılıak .... Bashuns ... . May

Hindu .- In addition to the Muhammadan teckoning there are four eras used in ludia. The principal astronomical system was the Kalum-ja Era, which appears to have been adopted in the fourth century A D. It began on 18 February, 3102 B C. The chronological system of Northern India, known as the Vikrama. of Northern India, known as the Vikrama amout Era, prevalent in Western India, began on 23 February, 57 BC The year 1933 AD. 18, therefore, the year 1938 of the Vikrama Eta. If Southern India, the Saka Era, with its epoch of 3 March, AD 78, was probably founded by Kanishka (whose sway was ndely extended), and is in general use. The tent 1931 AD is 1853 of the Saka Era. In the Hills, the Snytarsh Era dates from the moment when the Saptarshi, or saints, were translated and became the stars of

Year of Heefra

dhists and the Jains. The Buddhists reckoned from the death of Buddha in \$43 B.C. (the actual date being 487 B.C.); and the epoch of the Jains was the death of Vardhamana, the founder of

their faith, in 527 B.C.

Jawish .- The Jews hold that the world was created at the time of the Autumnal Equinox in created at the time of the Automate Futuros, the year 3760 B.C. or year 954 of the Julian Period, and the epoch or starting point of Jewish Chronology corresponds to October 7 B.C. 376z. Thus the year 1932 A.D. is Annus Mundi 5692-93 in the Jewish Calendar:

Muhammadan.-The Muhammadan Epoch is based on the Hegira or Flight of Muhammad from Mecca to Medina. The first day of the Era is not the actual day of the Flight but is rath July, 6as A.D. This Calendar is purely lunar. The year consists of 1s months of 30 or 39 days alternately, the last being sometimes 30, and therefore either 334 or 335 days in length. It follows that the Muhammadan year begins earlier year by year, according to Gregorian dates, by 10, 11 or 12 days. The year 1932 is 1350-31 of the Hegira. The dates of the beginnings of the months are shown below:—

Olympiads. - Greek chronology was reckoned Olympiads.— Greek chronology was reconsequent in cycles of four years corresponding with the periodic Olympia, in Elis, once in four years, the intervening years being the first, second, &c. of the Olympiad, which received the name of the victor at the tiames. The first recorded Olympiad is that of Chorochus, 776 B C.

Persian.—The chronology of Persia, which is still followed by the Parsees of India, dates from the accession of Yazdegerd III to the throne on 10th June, 632 A D The year 1931 is, therefore, 1300 of the Parsees. The New Year begins on 21st March.

Roman. - Roman historians adopted as an epoch the Foundation of Rome, which is believed to have happened in the year 753 BC, and the ordinal number of the year in Roman reckoning are followed by the letters AUC (Anno Urbis Conditie). The Calendar as we know has developed from one established by Romulus, who is said to have used a year of 304 days devided into ten months beginning with March, to which Nums added January and February, making the year lunar This became the Julian Calendar and later by a slight alteration the Gregorian (sec p. 8a) nowin general use. In the Roman(Julian)Calendar the days of the mouth were counted backwards from three fixed points, and an intervening day was said to be somany days before the next coming point the first and last being counted. three points were (3) the Kalends, by which hame the first of each month was known; (a) the Nones (suns days before the Ides) which fell on the seventh day of the month in March, May, July, and October, and on the fifth day in each of the other months; and (3) the Ides, which fell either The previous day is also observed as the on the 1sth or 13th, and thus divided the month nearly equally. The Latin equivalent of Dec. 3x, Note.—Daysofthe Jewish Calendar begin at sunset the day before that ante diem tertium Kalendas.

CHRONOLOGICAL TERMS.

The Day, Week and Month.—Measurements of time are based on the times taken by the earth to rotate on its axis; by the moon to revolve round the earth; and by the earth to revolve round the sun. From these which are not com-mensurable, certain average or mean intervals have been adopted for ordinary use. Of these the first is the Day, which begins at midnight and is divided into a hours of 60 minutes, each of 60 seconds. The hours are counted from midnight up to ze at noon, and again from noon up Hour reckoning is employed. The 24-hour reckoning ignores A.M. and P.M., and the hours are numbered o to 23 from midnight to midnight.

For the Astronomical Day, see p. 77.

The Week is a period of 7 days.

The Month in the ordinary calendar is approximately the twelfth part of a year, but the lengths

of the different months vary.

The Equinoctial or Tropical Year is the time that the earth takes to revolve round the sun that the earth takes to revolve round the sun from equinox to equinox, which is 365 agas mean days. The Calendar Year consists of 365 days, but a year the date of which is divisible by 4, without remainder, is called Leap Year and consists of 366 days. The last year of a century is not leap year unless its number is divisible by 400 (c.f.) the years 1800 and 1900 had only

400 (e.g. the years 1800 and 1900 had only 365 days).

Old and New Style.—In the Julian Calendar the contennial years were all leap years, and the contennial years were all leap years, and for this cason towards the close of the sixteenth century there was a difference of the sixteenth century there was a difference of the days between the tropical and calendar years (see above). In 1828 Pope Gregory ordained that Oct. 5th should be called Oct. 1814, and that overy fourth end-century year only should be a leap year (see above). This change was adopted by Italy, France, Spain, and Portugal in 1821; by Prussia, the German Roman Catholic Mtates, Switzerland, Holland, and Flanders on Jan. 1823, Poland 1826, Hungary 1827, the German and Netherland Protestant States and Demmark 1870. Sweden (gradually) by the omission of ryoo, Sweden (gradually) by the omission of eleven leap days, 1700-1740, the British Dominions (which included the then North American Coloules) in 1752, by the omission of American College in 1732, 19 and College Celeven days (Sept. 3) being reckoned as Sept. 14)
This "Gregorian" Calendar was adopted by
Japan in 1872, China in 1918, Bulkaria in 1915,
Turkey and Soviet Russia in 1917, by Yuwslavia and Rumania in 1919, and by Greece in February, 1923. The Russian, Greek, Serblan and Rumanian Churches did not abandon the Julian Calendar until May, 1923, when the Gregorian, slightly modified, was adopted. The difference between the Old and New Styles was 11 days after 1700, ze days after 1800, and has been 13 days since

New Year's Day .- In England in the seventh century, and as late as the thirteenth, the year was reckoned from Christmas Day, but in the twelfth century the Anglican Church began the year on the asth March, and this practice was adopted generally in the fourteenth century. The Civil year in the British Dominions (exclusive of Scotland) began with "Lady Day" until 1751. of Sootland) began with "Lady Day" until 1751.
But in and since 1752 the civil year has begun
with Jan. 1. Dividends are, however, still paid by
the Bank of England on the last day of Quarters
according to a reckoning based on Oid Style. The
Income Tax year begins on April 6 in accordance
with Act of Parliament (39 Geo. III. 1798).

New Year's Day has been changed in Scotland from Mar. as to Jan. 1 in 1500. On the Continent, Jan. 1 was adopted as the first day of the year by Venice in 1522, Germany in 1544, Spain, Portugal and the Roman Catholic Netherlands in 1556, Prussia, Denmark and Sweden in 1559, France 1564, Lorraine 1579, Protestant Netherlands 1583, Russia 1785, Tuscany 1751.

Golden Number.—In the year 422 B.C. Meton, an Atheman astronomer, found that 235 Lunations are very nearly, though not exactly, equal in duration to 19 Solar Years, and hence, considering the mean motion only, after 19 years the Phases of the Moon recur on the same days of the month. This discovery was held to be of so great importance that the dates of Full Moon in a cycle of nineteen years were inscribed in figures of gold on public monuments in Athens. The Cycle of nineteen years is called the Metonic Lunar Cycle, and the number showing the position of a year in the Cycle is called the Golden Number of that Year.

Easter-Day is the first Sunday after the full moon which happens upon, or next after the arst day of March; and if the full moon happens upon a Sunday, Easter-day is the Sunday after. This definition is contained in an Act of Parliament (a4 Geo. II., cap. 23), and explanation is given in the preamble to the Act that the day of Full Moon depends on certain tables that have been prepared. These are the tables whose essential points are given in the early pages of the Book of Common Prayer. The Moon referred to is not the real moon of the heavens, but a hypothetical Moon on whose heavens, but a hypothetical Moon on whose "Full" the date of Easter depends, and the lunations of this "Calendar" Moon consist of twenty-nine and thirty days alternately with certain necessary modifications to make the date of its Full agree as nearly as possible with that of the Moon of the heavens. The artificial Moon is accounted to be full on the fourteenth day, i.e., thirteen days after the New Moon, in order to be consistent with an early Jewish prac-tice, but this point is immaterial. The Full Moon of the Calendar on which Easter depends is called the Paschal Full Moon

By the above ordinance Easter falls on one of 35 days. A proposed reform that would limit it to one of 7 days has received Parliamentary support, but there is no prospect of its adoption Epact .-- The age of the calendar Moon on Jan. z in each year, formerly used in determining the date of Easter.

Solar Cycle.—A period of twenty-eight years, in any corresponding year of which the days of the week recur on the same days of the month.

Julian Period.-Proposed by Joseph Scaliger in 1582. The period is 7680 Julian years, and its first year coincides with the year 4713 B.C. 7680 is the product of the mimber of years in the Solar Cycle, the Metonic Cycle and the cycle of the Roman Indiction (28 × 19 × 15). The Julian Day, as used in astronomy, begins at noon.

Roman Induction.—A period of fifteen years, instituted for fiscal purposes about A.D. 300.

The Dominical Letter is one of the letters A-G which are used to denote the Sundays (Lord's Day) in successive years. If the first day of the year is a Sunday the letter is A; if the second, B; the third, C; and so on. Leap year requires two letters, the first for Jan. r-Feb. 29, the second from March r-Dec. 32. THE Superficial Area of the Earth is estimated to be 196,550,000 square miles, of which 55,500,000 square miles are Land and 141,050,000 square miles Water. The Diameter of the Earth at the Equator is 7.926 English miles, and at the Poles 7,000 English miles. The Equatorial Circumference is 24,901'8 English miles, divided into 360 Degrees of Longitude, each of 69'17 English (or 60 Geographical) miles; these Degrees are measured from the Meridian of Greenwich, and numbered East and West of that point to meet in the Antipodes at the 180th Degree. Distance North and South of the Equator is marked by Parallels of Latitude, which proceed from zero (at the Equator) to 90° at the Poles.

# ARRA AND POPULATION.

Continent.	Area in Square Miles	Estimated Population.
Europe	3,750,000 17,000,000 11,500,000 8,000,000 6,800,000 3,450,000	475,000,000 1,013,000,000 143,000,000 146,000,000 64,000,000
	55,500,000	1,849,500,000

The British Dominious extend over the largest area (14.250,000 St. miles); the Russian Union is second (9.350,000 St. miles); France is third, with 4.356,000 St. miles; the United States, with its Insular Jurisdiction, &c., covers 3.750,000 St. miles, Bivail 3.250,000 St. miles, and China 3.000,000 St. miles.

### THE CONTINENTS.

Europe forms about one-fourteenth of the Enrope forms about one-fourteened of the hald surface of the globe. Its longth from the North Cape, 72° 22° N., and Cape Matapan, in the south of Greece, 36° 22° N. is about 2,400 miles, and its breadth from Cape St Vincent to the trials is about 3,300 miles. The political boundary between Europe and Asia extends some distance beyond the l'ials, to include the mining regions, in the south-east it follows the valley of the Manych, north of the Caucasus.

Ama extends over nearly one-third of the land Asia extends over hearly obstante between its surface of the globe. The distance between its extreme longitudes, the west coast of Asia Minor (26° E) and the East Cape (x70° W), is 6.000 miles The extreme latitudes, Cape Chelynskin (76° 30° N.) and Cape Buru (50 miles north of the Equator), are 5,350 miles apart Asia is bounded by the ocean on all sides except the west The Isthmus of Sucz connects it with The land boundary between Europe and Asia is formed on the west mainly by the (ral Mountains and the Ural River. In the south-west the valley of the Manych, which

o'The Earth is a phere, with a Northern and Southern Hemsuskere, the Ocean surface is the Hadrosphere, and the gaseous envelope the Atmosphere, of which the lower layers are the Traposphere and the unper the Stratosphere. The science concerned with the study of the Earth's crut is Geology with the measurement of its surface is the Hadrosphere and the Graphy and of its superficial features Hauntreas is Graphy of the hydrosphere is Graphy of the hydrosphere is Graphy of the Hadrosphere is Graphy of the hydrosphere is Graphy of the Indeed Raminology, and of the mountains Oragraphy, of the Earth Hadrosphere is Graphy of extinct organic life Palarontology, and of exiting the Hology of their location Ethnography of extinct organic life Palarontology, and of existing the Hology of their location Ethnography of a given point of the Earth's surface at the Equator exceeds 2 con miles an hour would take nearly so years to reach the Sun. The velocity of a given point of the Earth's surface at the Equator exceeds 2 con miles an hour (space on miles in 36 days, 6 hours, 9 minutes).

stretches from the Caspian Sea to the mouth of. the Don, is now taken as the line between the two continents, although the Cancasus was formerly considered as belonging to Europe. The islands of the archipelago which lies in the south-east between the continents of Asia and Australia may be divided into two groups by a line passing east of Timor, Timor Laut, the Kei Islands and the Moluccas.

Is a sum the Moniceas.

Africa is about three times the area of Europe Its extreme longitudes are  $z\gamma^2$  W. at Cape Verde and  $z\gamma^2$  E. at Cape Guardatu. The extreme latitudes are tape Blanco in  $z\gamma^2$  N. and Cape Aculhas an  $z\gamma^2$  S., at a distance of about 5,000 nules

It is surrounded by seas on all sides, except in the narrow isthmus through which is cut the Suez Canal, and may be considered as a great peninsula of the Eurasian continent.

North America, including Mexico, is a little less than twice the size of Europe. Its extreme, longitudes extend from a little west of 270'W to 52'," W in the east of Newfoundland, and its extreme latitudes from about 80° N. lat. to rg' N. lat. in the south of Mexico. It is suirounded by seas on all sides except in the south, where it joins the Isthmian States of Central America, which have an area of about 200,000 square miles The area of the West Indies is about 65,000 square miles, a little more than half that of the United Kingdom. They extend from about 27 N latitude to 20 N. latitude.

South America is a little more than 1% times the size of Europe The extrems longitudes are Cape Branco 33° W. and Punta Parina 81° W., and the extreme latitudes, Punta Gallmas, 1232 N. and Cape Hoin 56 S South America is surrounded by the ocean, except where it is joined to Central America by the partow isthmus through which is cut the Panama Canal.

# THE BACES OF MANKIND.+

The Races of Mankind are divisible according to Stock or, less scientifically, according to Colour The Dominant Colour is Yellow—the numerical order being (2) Yellow, (2) White,
(3) Black, (4) Brown, (5) Red The main Divisions
of the Races are as follows.—

-		4
Division	Area	Estimated Number
	, <del></del>	T
Negro	Asia Europe & Orient Africa North Africa Oceania, &c America	680,000,000 725,000,000 210,000,000 100,000,000 104,500,000 30,000,000
		1,849,500,000
	1	

† 15 has been estimated that the Earth can maintain a population of 6,000,000,000, a total which will be reached about A.D. 2200, at the present rate of increase

# OCEAN AREAS AND DEPTHS.

The greatest known Ocean Depth (in the Pacifit, off Mandanao, 32.05g feet) is not much greater than the greatest land height (in the Himalavas), but the mean depth of the Ocean floor exceeds 12.05g feet, while the mean height of the surface of the land area of the Earth above sea layed is only a 300 feet. The following table

gives the areas of with the greatest	the princip	al oceans and seas, th of each :
	Oceans	
* Name		Greatest Depth
Pacific	(sq miles)	Off Mindanao,
* HOTHE	03,980,000	32,080
Atlantic	31,530,000	Porto Rico Trench,
	3-,33-,	31,366
Indian	28,350,000	Sunda Trench.
		aa.e68
Arctic	5,541,600	North Polar, 13,200
	Scar.	
Malay	3,137,000	Kei Trench, 21,342
Central American		Cartbhean, 20,568
Mediterranean	1,145,000	Pola Deep, 12,275
Behring	878,000	Buidir Trough,
Okhotsk	_	13,422
OKHOUSK	582,000	Kurıle Trough,
East China	.0	10,554
Hudson Bay	480,000 472,000	about 10,500 about 1,500
Japan	405,000	about 10,200
Andaman	305,000	about 11,000
North Sea	221,000	Skaggerak, 1,998
Red Sea	178,000	20° N , 7,854
Baltic	158,000	about 1,200

# : TEMPERATURE AND

GENERAL: The maximum temperature on record of the air in shade is 134° Fahr., observed at Greenland Ranch, California, on July 10, 1912.

The wettest station in the world is generally allowed to be Cherra Poonjee in Assam, where 22.83 inches. On one of these days, June 14, 40.80 inches fell in 24 hours.

BRITISH ISLANDS: The maximum temperature of the air recorded in the shade at 4 feet above the ground is 100° Fahr. This was observed at Wilton House, Salbsury, on July 15, 1881, and at Greenwich Observatory on Aug. 9.

The lowest temperature of the air recorded

RAINFALL RECORDS.
in the shade at 4 feet above the ground is
-a3° Fahr., or 55° below freezing point, at
Blackadder, Berwickshire, on Dec. 4, 189.
The greatest rainfall in a day was at Bruton,

somerset, when 9'36 inches fell in the 24 hours ended 9 a.m., June 29, 1927. This rainfall is equal to 965 tons of water per acre.

The total rainfall for a year at Stations in the British Islands during the 55 years 1890 to 1924 ranged from 246 gs inches at Llyn Llydaw (Copper Mill), Carnarvon, and 247 30 inches at the Stye, Cumberland in 1923, to 9 29 inches at Margate in 1921.

The maximum wind-velocity on record in the British Isles was recorded at Scilly on December 6, 1929, when a gust reached the rate of xxx miles per hour.

# The League of Mations.

THE League of Nations came into being when the Treaty of Peace with Germany was ratified on January 10, 1320. Its Charter, containing 26 Articles, is known as the Covenant, which begins

with the following words :-

"The High Contracting Parties, in order to promote international co-operation and to achieve international peace and security by the acceptance of obligations not to resort to war, by the prescription of open, just and honourable relations between nations, by the firm establishment of the understanding of international law as the actual rule of conduct among Governments, and by the maintenance of justice and a sempnlous respect for all treaty obligations in the dealings of organised peoples with one another, agree Covenant of the League of Nations"

The Covenant of the Learne contains fundamental clauses on the prevention and settlement of disputes. These clauses bind nations who are members of the League not to employ force for the settlement of a dispute until they have first submitted it to the League of Nations (or to arbitrators or to judges) The right to re-sort to war was hitherto retained in case the League, or the arbitrators, failed to reach an unanimous decision, but even so, only after a delay of three months after such failure.

The Membership of the League comprises at present a nations, or three equatiers of the whole World, the British Empire and the Dominions (including the Irish Free State, together with India) being each an independent member, with separate voting power and representation. The only two great countries which hold aloof are America and Russia, and they, particularly America, are co-operating with the League in

a number of beneficent activities.

# ORGANISATION OF THE LEAGUE.

The Assembly meets annually at Geneva about September 10, and consists of 3 representatives from every Member State, each State having

The Council meets three times a year. Britain, France, Italy, Germany and Japan are permanent members, and at present 9 other States are annually elected as temporary members. These are Poland, Yugoslavia, Pern, Spam, Venezuela, Persia, Guatemala, Norway and the Irish Free State

The Secretariat is the permanent Civil Service of the League, at Geneva, and is composed of nationals of nearly all Member States Secretary-General, Hon Sir Eric Drummond, K.C.M.G., C.B. (British).

Deputy Secretary-General, J. Avenol (French) Under Secretarier-General, Marquis Paulnou di Calboli (Italian), M Dufour Féronce (German),

M. Y. Sugimus (Japanese) Information Section, Fierre Comert (French), Director ; Arthur Sweetzer (American), Assis-

tant Director

The Technical Organisations and Commissions, which act as expert advisers to the Conneil and Assembly, are continually handling questions concerning International Communication and Transit, Economics and Finance, Health, Mandates, and the Reduction of Armaments. No week passes without these bodies discussing international questions of wide interest, or without some conference being held at Genera and

achieving constructive work in international

co-operation.

The Permanent Court of International Justice, consisting of fifteen Judges and four Deputy Judges, chosen for their high legal and moral authority, sits at the Hague and deals by means of opinions and judgments with all disputes referred to it regarding International Law, breaches of International obligations, and the interpretation of treaties. It has already dealt with 35 disputes, some of which might have led to an open heach between the States concerned. It has already won a great reputation both in the Foreign Offices and in the legal professions of the world. The annual session begins on June 15; but in future the Court is likely to sit all the vear round

The International Labour Office is closely connected with the League, but has a parallel organisation of its own at Gene a, which was also set up by the Peace Treaty. The Governing body represents twelve States, of which eight (including freat Britain, Canada and India) are chosen as being of chief industrial importance in the world They are assisted by an international Secretariat, which collects and disseminates information and organises conferences The conferences, to which Governments, Employers and Workers' Organisations send delegates, pass Conventions or Recommendations which Governments ratify if they so desire. There have already been over 400 ratifications of Labour Conventions. The man object in view is to bring up the standard of labour in the less advanced States to the level of the standard in countries where greater progress has been made. The Director of the International Labour Office is Albert Thomas (French), the Deputy-Director H. B. Butler (British). There is a Loudon office H. B. Butler (British). That zs Victoria Street, S.W.z.

Cost — The cost of the League, 1930-1, will be about £1.260,000, to which Great Britain contributes 20112

tributes some £ 120,000.

WHAT THE LEAGUE HAS DONE.

The work of the League is many-sided, and is constantly growing. It includes the prevention of a number of wars, the creation of the Permanent Court at the Hague as an alternative for war, positive reconstruction as in the case of the war, positive reconstruction as in the case of one financial nestoration of Austria, Hungary, and Northern Greece, the outlining of an important new policy of "freer" trade, improvements in international traffic and health, progress in real control of the traffic in drugs and in women, and child welfare. After ten years' continuous study of the problem of the Reduction of Armaments the League has reduced it to three bedrock principles-Arbitration, Security and Disarmament The purely technical study of Disarmament is now sufficiently advanced for the first general World Conference to be held, it is hoped, before the Twelfth Assembly meets in Sept 1931. LEAGUE OF NATIONS UNION.

LEAGUR OF NATIONS UNION, 15, Grosvenor Crescent, S.W. 1. - Joint Presidents, Viscount Grey of Fallodon, K.G., and Viscount Cecil of Chelwood, K.G.; Charman of Executive Com-muttee, Prof. Gilbert Murray, LL.D.; General Sec., J. C. Maxwell Garnett, C.B.E., Sc.D.

Any information about the League and its work can be obtained by application at this address.

The House of Windsor is in direct descent from (inter alion) Ecgleit, King of Wessex, Alfred the Great and William the Conqueior, also from the Emperor Chatlemagne (b. 742, d. 814), Rodingo the Cid (b. 1030, d. 1099), the Emperor Barbarossa (b. 1123, d. 1129) and St. Louis, King of France (b. 1115, 1129).

# WELSH SOVEREIGNS AND PRINCES.

WALES was ruled by Sovereign Princes from the "carliest times" until the death of Llewellyn in 1282. The first English Prince of Wales was the son of Edward I, and was born in Carnarvon town on April 25, 1284. According to a discredited legend, he was presented to the Welsh chieftams as their Prince, in fulfilment of a promise that they should have a Prince who "could not speak a word of English" and should be native born. This son, who afterwards became Edward II., was created "Prince of Wales and Earl of Chester" at the famous Lincoln Parliament on February 7, 1301. The present Prince was installed in Carnarvon Castle on July 23, 1311.

#### (6) The Prince John.

6. H.R.H. PRINCE JOHN, born July 22, 2905, died Jan. 28, 1919.

#### ORDER OF SUCCESSION TO THE THRONE.

The sons of the Sovereign are in the order of succession to the throne, and after the youngest son the daughters, in the order of their own seniority. Thus after the Prince of Wales and the Duke of York would come the Princes Elizabeth and the Princess Margaret, daughters of the Duke of York, the Duke of Gloucester and the Prince George; then Princess Mary and her children; then, as His Majesty has no brother, his sisters, with the children of the eldest in preference to the second sister; then the second daughter of the late Duke of Saxe-Coburg (his eldest daughter, Queen Marie of Rumania, having formally renounced on her marriage all possibility of claim to the British Throne). After traversing the Saxe-Coburg branch, we treat similarly those of Connaught and Albany. Having thus exhausted the families of all Queen Victoria's sons we turn to her daughters, beginning with the house of the late Empress Frederick; but as this line, with the ex-German Emperor at its head, is wholly out of practical lounds, it would be profitless to pursue the investigation any further.

#### ANNUITIES TO THE ROYAL FAMILY.

The annuities payable to Their Majesties and to the members of the Royal Family are known as the Civil List, which is granted by Parliament upon the recommendation of a Select Committee. The Civil List of King Edward VII. amounted to  $\mathcal{L}_{470, \infty0}$ , in addition to which annuities to other members of the Royal Family accounted for an additional annual sum of  $\mathcal{L}_{500, \infty0}$ . The Select Committee appointed on June 14, 1910, reported on July 7, and made recommendations, which were adopted by the House of Commons. These recommendations, as modified by subsequent events, are also subject to the voluntary deductions announced by H.M. the King.

divition, and analy analyses to the foldings:	, acamoun
Their Majesties' Privy Purse	£.110,000

### Peeresses in Their Own Right.

PEERESSES IN OWN RIGHT.—Peerages are occasionally granted immediately to ladies of distinction or the widows of distinguished men; but frequently the instances falling under this heading are the result of regular inheritance in lines which are open to females in default of males. Thus it results that some of the Peeresses now upon the list have male heirs who will succeed them in the ensuing generation and take their seats by strict right in the House of Lords; while, on the other hand, several peerages now occupied by males will fall to the other sex, and thus for a time take leave of that House. A resolution to admit Peeresses in their Own Right to the House of Lords was defeated in that house in 1930. A Pecress in her own Right retains her title after marriage, and if her husband's rank is the superior she is designated by the two titles jointly, the inferior one last: her hereditary claim still holds good in spite of any marriage whether higher or lower. No rank held by a woman can confer any title or even precedence upon her husband; but the rank of a Peeress in her own right is inherited by her eldest son (or perhaps daughter), to whomsoever she may have been married.

## Courtesp Titles borne by Eldest Sons (in actual use in 1932).

Holders of Courtesy Titles are addressed in the manner shown for holders of substantive titles

From this list it will be seen that the "Marquess of Blandford" is the heir to the Dukedom of Marlborough; that the "Earl of Altamont" is the eldest son of the Marquess of Sligo, while "Viscount Acheson" is heir to the Earldom of Gosford, and "Lord Aberdour" to the Earldom of Whether the talless borne by second here are also given, e.g., Earl of Burlington, "elast some of the "Marquess of Hartington," her to the Dukedom of Devonshire, "Viscount Baylam," eldest son of the "Barl of Brecknock," here to the Camden Marquessate, and "Viscount Savernake," eldest son of the "Earl of Cardigan," here to the Marquessate of Alleshury.

NOTE .- In titles marked o the " of " is not used.

. In addition to the above Titles of Courtesy the eldest son of Scottish Viscounts and Barons is usually styled "The Master of —" e.g. "The Master of Falkland," eldest son of Viscount Falkland; "The Master of Carnegie," eldest son of Lord Carnegie and grandson of the Earl of Southesk.

Contractions used in pages 111-129.

Contractions.—S. or I. appended to the date of creation denotes a Scottish on Irish title; the further addition of a * implies that the Peer in question holds also an Imperial title, which is rurrner another or a "implies that the Feel in question fields also an imperial title, which is appecified (after the usine) by its more definite description as Engl., Ent. or U.K. When both titles are alike, as in the case of Argyll, this star is appended to the conjoined date below, and it then denotes that such date is that of the Imperial creation. A  $\uparrow$  appended to S. or I. Implies that the Peer is an elected Representative to the House of Lords. For the mark 'see heading to Marquesses; b. signifies born; s., succeeded; m., married; w., widower or widow; M., minor.

## THE GRAND PRIORY IN THE BRITISH REALM OF THE VENERABLE ORDER OF THE HOSPITAL OF ST. JOHN OF JERUSALEM.

(INCORPORATED BY ROYAL CHARTER)

THE Order had its origin in Jerusalem as an International lay confraternity for the relief of Christian pilgrims to the Holy Land, and was later sovereign in Rhodes and Malta, where its Christian pagring to the 1011 Land, and was later sovering in Lindes and Mats, where he Knights kept galleys and galleons to attack the Baibary Corana and to prevent the spread of Turkish rule in the Mediterranean, from 1530 to 1798. The objects and numposes of the Order are, amongst other things, the maintenance of the St. John Ophthalmic Hospital at Jerusalem, and the St. John Ambulance Aracciation and Brigade at Home and Overseas, and the London Light and Electrical Clinic for poor people. The Order is conferred for services in the cause of humanity throughout the Empile, and is open to both men and women. There are 5 classes: Balliffs and Dames Grand Cross, Knights and Dames of Justice and of Grace; Commanders of both seves; Officers of both seves; Serving Brothers and Saters These distinctions are notified in the London Gazette, but do not confer any rank or title. The ribbion of the decorations of the Order is black (watered). Headquarters St. John's Gate, Clerkenwell, E.C.1.

# England, Great Britain, U. K., Baronets. (Exclusive of such as are Poece.)

Scotland or Neva Scotla (88, marked S).

Note.—Clause II. of the Royal Warrant of February 8, 2010, ordains as follows:—"That no person-whose name is not entered upon the Official Roll shall be received as a Baronet, or shall be addressed or mentioned by that title in any Cityl, or Military Commission, Letters Patent or other official document." In the cases of titles printed in titiles the holder of the Baronetsy has died but no person has proved his succession to the Baronetcy. Baronets are addressed as "Sir" (with Christian name) and in writing as "Sir Robert A.—, ht." Baronets' wives are addressed (formally) as "Your Ladyship" or "Lady A.—," without any Christian name unless a daughter of a Duke, Marquess or Earl, in which case "The Lady Mary A.—"; if daughter of a Viscount or Baron "The Hon. Lady A.—."

CHE; DS.O.; M.V.O.(4th), OBE; 1.8 0

Eldest Sons of younger Sons of Peers.
Baronets' eldest Sons.
Eldest Sons of Knights in the same
order as their Fathers.
M.v.o.(gth); M.S.Z.

Younger Sons of the younger Sons of Peers Baronets' younger Sons.

Younger Sons of Knights in the same order as their Fathers. Naval, Military, and other Esquires by Office.

by Office.

Women take the same rank as their husbands or as their iddest brothers; but the daughter of a Feer marrying a Commoner retains her title as Lady or Honourable. Paughters of Feers rank next immediately after the wives of their older brothers, said before their younger brothers wives l'aughters of Peers marrying Feers of lower degree take the same order of preceduncy as that of their husbands; thus the daughter of a Duke marrying a Baron degrades to the rank of Baronics only, while her sisters married to commoners retain their rank and take precedence of the Baronicss and take precedence of the Baronicss Berrely official rank on the husband's part does not give any similar precedence to the wife.

For Dames Grand Cross and Dames Commanders of the British Empire, see p zg8.

LOCAL PRECEDENCY. — No written code of county or city order of precedence has been promulgated, but naturally in the county the Lord Identenant stands first, and secondly the Sheriff. In London and other Corporations, the Mayor stands first, after him the Addermen, Sheriffs, Chief Officers, and Livery. At Ourfoard and Cambridges the Light Berriff takes precedence of the Vice-Chancellox.

For fuller tables (and for Scottish and Irish Precedency) see Introduction to "Whitaers's Perhade, Barderaue. Krightaer and Companionade," a companion rotume, price set not.

5 A complete list, in Apparenced Corder (the only list so published), of all holders of these deburations will be found in "Whitaers Perhade.

### THE ORDER OF MERIT (1902)-O.M. Rubbon, Blue and Crimson.

This Order confers no precedence. It is designed as a special distinction for enument men and women—without conferring a knighthood upon them. The Order is limited in numbers to a4, with the addition of foreign homorary memlers. Membership is of two kinds, Millary and Civil, the badge of the former having crossed swords, and the latter oak leaves. Membership is designated by the suffix o x, which is authorised to follow the first class of the Order of the Eath and to precede the Letters designating membership of the inferior classes of the Bath and all classes of the remaining Orders of Knighthood.

# mames Grand Cross and Dames Commanders of the Graek of the British Empire.

NOTE.—Dames Grand Cross (G.B.E.) and Dames Commanders (D.B.E.) are addressed in a manner similar to that of Knights Grand Cross or Knights Commanders, e.g. "Miss Florence Smith," after receiving the honour of G. (or D.) B.E. would be addressed as "Dame Florence," and in writing, as "Dame Florence Smith, G. (or D.) B.E." Where such award is made to a lady already in enjoyment of a higher title the appropriate letters are appended to her name. c.g. "The Countess of _____, C.B.E." Dames Grand Cross of the British Empire rank after wives of Baronets and before wives of Knights Grand Cross. Dames Commanders rank after the wives of Knights Grand Cross and before the wives of Knights Commanders.

## THE VICTORIA CROSS. FT.

Ribbon, Crimson for all Services.

The Victoria Cross was instituted in 1896, on the close of the Crimean War, and extended in 1891 and 1892. The decoration is worn before all others, on the left breast, and consists of a bronze Maltese Cross, 13/2 inches in diameter, with the Royal Crown surmounted by a lion in the centre, and beneath there is the inscription "For Valour." A special annuity of \( \frac{1}{2} \) as year is granted to every recipient below Commissioned Rank, with an additional \( \frac{1}{2} \) a year for every bar, such barbeing added for additional acts of bravery which would have entitled the recipient to the Victoria Cross if he or she had not already received it. In the eyent of an annuitant being unable to obtain a livelihood on leaving the Service, the amount of the annuity may be increased to \( \frac{1}{2} \). In 1821, the right to receive the Cross was extended to Indian soldiers, and in 1820 a Royal Warrant extended the right to Matrons, Sisters and Nurses, and the Staff of the Nursing Services and other services pertaining to Hospitals and Nursing, and to Civilians of either sex regularly or temporarily under the orders, direction or supervision of the Naval, Military or Air Forces of the Empire.

THE KING'S SPEECH.—For the first time since his illness, the King opened the new Session on Oct. 28, and read his Speech in firm, clear tones in the presence of the Queen, the Prince of Wales and a brilliant gathering. He referred with sympathy to the continuance of heavy unemployment, and said that the Government would persist in its efforts to develop and extend home, Imperial and foreign trade and to help in measures that would lead to greater efficiency in industry. Proposals would be made for the promotion of increased settlement and employment on the land and of large-scale farming operations, for the acquisition and improvement of agricultural land in need of re-conditioning. and for the organisation of producers for marketing purposes. A Commission would be set up immediately to enquire into the whole question of unemployment insurance and the allegations of abuse of its provisions, further financial provision for the Unemployment Fund being meanwhile made. Legislation to secure for the community its share in the site value of land and a measure of electoral reform would be introduced, and measures would be submitted for raising the age of compulsory school attendance, amending the law relating to trade disputes and council. Other legislation promised in the Speech related to the extension of the law concerning town planning, the amendment of the Factory Acts and the establishment of a new statutory authority to deal with passenger traffic in London. In the Lords, the Address in reply was moved by Lord Sanderson, a blind peer, and seconded by Lord Marks, and was agreed to. In the Commons, atter Mr. Charleton had moved and Mr. W. Taylor had seconded the Address, the Prime Minister informed Mr. Baldwin that the Royal Commission on Unemployment Insurance was necessary to keep recom-mendations for the reform of the system free from party taint, and declared that the removal of the Trade Disputes Act would morease the chances of industrial peace and end a piece of prejudiced legislation. The first amendment, moved by Mi. Jowett on Oct. 31, called for Socialist reorganisation of industry, agriculture, banking and the import and export trades and for the fairer distribution of the national income It was rejected by 156 to 11. Mr. Neville Chamberlain on Nor. 3, moved the official Opposition amendment, which expressed regret at the failure of the Government to propose any measures adequate to deal with the crisis in the industrial, agricultural and commercial situation industrial, agricultural and commercial situation or to check the continued growth of unemployment. Mr. MacDonald on the following day said that the rise in unemployment was meyitable, whatever dovenment had been in power. They were encouraging the re-organisation of one industry after another, and would not be held up indefinitely by the refusal of any industry to cut out dead wood. The amendment was defeated by any and the Address was feated by sar to sgo, and the Address was agreed to.

THE TRADE DISPUTES ACT .- One of the most important measures submitted by the Government was the Trade Disputes and Trade Unions

the sympathetic industrial strike should not be illegal. No one should be charged with intimidation, and a corporate body should have control of its funds. The Bill also sought to prevent individual convictions before an authoritative pronouncement upon the legality of a strike, and declared that the minority of a trade union must follow the majority in questions concerning the use of funds. Outlining the Liberal policy, Mr. Norman Birkett said they considered that the Bill would make a repetition of the general strike perfectly legal. They held that contracting in had justified itself, and they They held would insist on maintaining it. During the final stages of the debate on Jan 28, Sir Stafford nnai stages of the debate on Jan as, Sir Manord Cripps, the Solicitor-General, declared that under the law as it existed before the Act of 1927, the general strike of 1926 would have been legal, because one of its motives had been undustrial, but that under the new Bill the general strike would have been idegal, because he was sure that the Courts would have found that the primary object was not industrial. The second reading was carried by 27 to 250, and the Bill was sent to a standing committee, where the treatment it received resulted in its abandonment by the Government. Sir William Jowitt explained early, on Feb. 12, that the Government intended to restore to the trade unions the full liberty of action which they possessed in 1926 so long as a sympathetic strike was industrial. Dr. Burgin on Feb. as moved an official Liberal amendment to introduce words to make illegal any strike or lock-out of which the effect was to expose the community, or any substantial part of the community, to danger to health or safety by interfering with the supplies or distribution of essential food, water, fuel, light, medical or sanitary services or other necessities of life. The amendment was described by supporters of the Government as a wrecking amendment, but it was carried by 37 to 37 on Feb. 36. When the committee net again on March 3, the Attorney-General announced that the Government would not proceed with the Bill as a consequence of this change, and said that its effect would be to put the unions in a more difficult position than they had been in at any time during the last fifty venie

THE BUDGET.—Still suffering from the effects of a rather serious illness, Mr. Snowden introduced his Budget on Appl 27, the main feature being a promise of duties on land values when the necessary valuation had been completed The Chancellor estimated a sotal revenue of £766,000,000 and a total expenditure of £803,366,000, leaving a gap to be bridged of £37,366,000. He proposed to take powers to enable present holders of Savings Certificates enable present holders of Savings Certificates due for repayment in 1938 or 1933 to extend their investment. Mr. Snowden emphasized that his task of covering the estimated deficit was exceptionally hard owing to the great depression in trude. He rejected the idea of a revenue tariff, which he described as a means of relieving the well-to-do at the expense of the poor, and as an indirect attack on, and reduction of wages. His problem was largely a temporary one, he declared. A revival of trade, when it came, would be followed by an expan-(Amendment) Bill, and its abandonment was porary one, he declared. A revival of trade, due to Liberal criticism. Moving the second when it came, would be followed by an expanreading on Jars 2s, 'ir William Jowitt said that ston of revenue and a reduction on the expenthe sort of strike which must be made illegal diture side in respect of unemployment. In the was the revolutionary or political strike, but midst of "this economic blizzard, more severe than our generation has ever known," he felt justified in seeking relief by means of non-recurrent revenues and temporary expedients, There were two resources to which he could turn. He felt that the Exchange Account of \$33,000,000 set up to purchase foreign exchange to finance payments of our obligations abroad could be reduced by \$40,000,000, largely because of the establishment of the Bank of International Settlement. The other source was obtained by partially withdrawing a concession in regard to income tax. The yield would suffer from the fall in profits due to trade depression, and he decided not to propose any increase in the standard rate. He proposed instead that the practice of paying two equal instalments of tax under Schedules B, D, and E, should be altered, so that three quarters should be paid on Jan.x, and the remaining quarter on July z. The result would be that the Exchequer would get is an extra quarter of the year's tax within the present financial year, and the following year's yield would not be affected. These two sources, he considered, would reduce the estimated deficit by £30,000,000, and he proposed to obtain the remaining sum by adding twopence to the duty on oil, making it sixpence, instead of four-pence. The balance sheet for the current year would therefore he-revenue £803,500,00 expenditure £803,386,000, leaving a nominal margin of £124,000. "If we can effect substantial economies during the year," Mr. Snowden and, "and if there is some improvement in trade, I do not think next year's Budget need be unduly slarming, but falling this, next year a heavy increase of taxation will be inevitable." Then the Chancellor came to the highly controversial part of his speech. He intended, he said, to include in the Finance Bill provision for the taxation of land values, provision for the necessary and preliminary step of valua-tion, and provision for the imposition of a tax on land values upon the valuation thus obtained. The impost would not become operative during the current year, but he hoped that the valuation would be completed within two years from the passing of the Finance Bill. The tax would be at the rate of one penny in the pound on capital land value. Chancellor declared that he was convinced that the proposals which would be submitted would be supported by the great majority of the House and the country. "The scandal of private appro-priation of land values created by the enterprise and industry of the people and by the expendi-ture of public money has been tolerated far too long," he contended. The present system moon in the way of social and economic progress. It inflicted crushing burdens on industry and hindered municipal development. He prophecied that they would look back upon that Budget as a landmark on the road of social and economic progress, and as one further stage towards the progress, and as one further stage towards the emancipation of the people from the tyranny and the injustice of private land monopoly. Presenting the Opposition case on the following day, Mr. Neville Chamberlain said that the anticipation of the income tax would be a serious hardahp on the victims. This was the last Free Trade Budget, he declared, and no sham optimist could disguise its revelation of the importance of an out-worn fiscal waters. A new importance of an out-worn fiscal system. A new procedure was required for the land values proposals, and, on April 20, on the Chancellor's motion, the House agreed that notwithstanding

the established practice provision night be made in the Finance Bill for giving effect to any resolution for imposing a tax on land values, although the tax was not to come into operation until a subsequent financial year. He explained that as soon as the Bill was passed the work of valuation could begin, and it was hoped it would be completed before the tax came into operation two years hence. Mr. Snowden, on May 4, moved that there should be charged for the financial year ending March 31, 1933, and for every subsequent financial year, a tax at the rate of one penny for each pound of the land value of every unit of land in Great Britain. He said that between zo,000,000 and 12,000,000 hereditaments would have to be walned by a vast staff who could not begin the work until October. Revenue could not be re-ceived until 1933, but meanwhile the threatof the tax would cheapen land at once. He put the cost of valuation at £1,500,000. Agricultural land would be exempt as long as it had a cultivation value. This meant that land used for allotments or market gardens would only be taxed on the difference between its value for cultivation and its value for other purposes. The basis of valuation was to assume that the land was bare of buildings and works, and that the surrounding land was as it actually was. Then the valuer would estimate how much a willing purchaser would give a willing seller for the land, and upon that figure the tax would be levied. Those who owned land valued at less than £120 a year would be exempt, almost all working-class houses being thus exempt. The resolution was carried by allo to ago on May 6, and the report stage was passed on the following day after the rejection of a Conservative amendment to make it clear that improvements in site value, due to the enterprise of the ments in site value, due to the enterprise of the owner or his predecessors in title, should be excluded from the tax. The Finance Bill received its second reading on May 19, Mr. Neville Chamberlain's motion for rejection being defeated by 270 to 230, and the committee stage opened under a guillotine arrangement on June 3. The Opposition strongly contested the land tax, which the Solicitor-General estimated would require an extra staff of only a conmated would require an extra staff of only 2,000. One amendment to deduct the cultivation value of urban land from the site value assessed to tax instead of deducting only in the case of agricultural land was carried on June 15 on a snap division, by age to sos, the Prime Minister afterwards declaring that it was a purely drafting matter. The future of the Bill —and of the Government—was imperilled for some time by a Liberal threat to withdraw their some time by a interact of double taxation were dealt with. After negotiations, Mr. Snowden on June 25 moved an amendment of meet the objections. It provided that the land value of every land unit should be reduced either by a sum equal to four times the annual value for purposes of income tax or by a sum equal to seveneighths of the land value of the unit. During the report stage, the Chancellor on July a, moved an amendment to exempt from the tax land used as a playing field under some agreement which could not be determined for at least five years, or if it were probable that the land would continue to be so used for one year or more. This was carried, as was another Government amendment changing the first valuation date from Aug. z, 2932, to Jan. 1, 1932, and fixing the second valuation date at Aug. 2, 1935. The third reading was carried on July 3, after the defeat by 274 to 252 of an amendment for rejection. The House of Lords quickly passed the Bill, which received the Speaker's certificate that it was a money bill and could not therefore be amended by the Peers, and the Royal Assent was given on July 31, when Parliament adjourned.

ELECTORAL REPORM. -- The introduction of the principle of the alternative vote and the abolition of university representation were the main features of the Electoral Reform Bill, which was read a second time in the House of Commons, by age to sae on Feb. 3, after a two days' debate. The Home Secretary, explaining the proposals, said that the Government in bringing the Bill forward were fulfilling a moral duty and not signing a pact with the Liberals. The Bill, although it fell short of what the Labour Party would like, would effect a real, far-reaching improvement in our electoral system. The Labour Party regarded the abolition of the system of plural voting as essential, while the alternative vote had the advantages and convenience of the second ballot without the latter's inconvenence and trouble, and prevented the election of a candidate against the wishes of a constituency. The Bill proposed to divide the existing double-membered constituencies into two, each of which would return a single member, schemes for the division being prepared by commissioners and laid before Parliament. The business premises qualification, except in the City of London, and Universities con-stituencies would be abolished, votors in the City being prohibited from voting elsewhere. The Bill also provided that motor cars and other vehicles could not be used at elections unless registered with the returning officer. Sir Samuel Hoare described the Bill as a Socialist bid for Liberal support for a majority until 1934. For the Committee stage a time table was adopted, and when it opened on March 4, the Government accepted an amendment delaying the operation of the alternative vote system until the dissolution of the present Parliament. The Government were defeated on March 16 by 146 to 242, on the clause abolishing University representation, which was deleted. The committee stage was completed on May 12, and the third reading was secured on June 2 by 278 to 228. In the Upper Chamber the second reading was agreed to by 50 to 14 on June 16, but the Peors made a number of important changes in committee. An amendment to limit the operation of the alternative vote to London boroughs, other than the City and boroughs elsewhere with other than the city and doroughs ensemble when a population exceeding socioo, was carried by so to so on July s, and on July 9 the Lords deleted the clauses dealing with the business premises qualification, plural voting, and the use of motor cars. These were restored by the Commons on July 16 when other amendments by the Upper Chamber were disagreed with, but no further progress was made with the Bill.

UNEMPLOYMENT INSURANCE.—Several Bills amending the unemployment insurance system were brought forward by the Government, pending the report of the Royal Commission to inquire into the question. The first Bill, which received the Royal Assent on 'Dec. 19, was necessitated by the fact that the debt of the

Unemployment Insurance Fund was approaching the borrowing limit of \$50,000,000, which, it was explained, would be reached by Christmas, and which was accordingly increased to \$70,000,000. Mr. Lawson said that the deficiency in the Fund was due to the increase in unemployment. At the same time a Bill was passed to retain in insurance an number of persons who would otherwise have fallen out of insurance within the wise have fallen out of insurance within the succeeding few months. Later another Bill was placed on the Statute Book, raising the borrowing limit of the fund to £00,000,000 and extending the transitional period by six months. Then on June 22, a money resolution was passed which sanctioned yet a further increase of the Fund to Grzg.coc.co. Miss Bondfield, instifying the Government's policy, declared that to increase contributions and decrease benefits would mean greater exactions from industries already heavily depressed and a lowering of the standard of living of the unemployed. The Bill based on the resolution received a second reading on fune as after the defeat by sac to x8 of a inction for rejection, and the Royal Assent was given on July 8. Finally, a Bill dealing with some of the anomalies pointed out by the Royal Commission was passed by the time Parliament adjourned. It imposed a test on habitual part-time workers as to whether they intended to work a full week or not, and laid it down that benefit should not be a dowry to give a married woman independence but to relieve an unemployed married woman still habitually employed. The Bill also set up an advisory committee to submit draft regulations to the Minister of Labour with a view to removing anomalies. An amendment for the rejection of the Bill, moved by Mr. Maxton, was defeated by sar to 19 during the second reading stage on July 8.

HELP FOR AGRICULTURE.—Among the measures passed before the adjournment were two designed to assist agriculture. The first was the Agricul-tural Land (Utilisation) Bill, which set up an Agricultural Land (Orporation with power to acquire land by agreement with the owners for large scale farming experiments. Explaining the proposals when he moved the second reading on Nor 13, Dr. Addison said that they were intended to increase employment and to develop a system which would make good dilapidation. Demonstration farms, which must be self-supporting, were to be established. Where it was shown that land had been seriously neglected, and continued to be neglected, there would be powers continued to be neglected, there would be power to take it over compulsorily. There would also be powers to facilitate the provision of allot-ments, where there was a specially large number of men unemployed. The second reading was carried on Now, 28 by 297 to 326, and the Bill was sent to a standing committee. The third reading sent to a standing committee. The third reading was agreed to by 38s to ass on Feb. 10. When the Bill reached the Upper Chamber, it was dealt with severely. The Bill was given a second reading on Feb. 15 on the advice of Lord Hailsham. In committee, the clause providing for the establishment of a Land Corporation was deleted on April so, and other clauses were struck out before the Bill was read a third time on May az. The Commons disagreed with the amendments and restored the deleted clauses, but the Lords insisted on the omission of the clause dealing with large scale farming experiments, and the Bill was given the Royal Assent in this form on July 3z. The second measure, the Agricultural

Marketing Bill, was outlined on Feb. 9 by Dr. Addison, who estimated that better marketing would add £100,000,000 year to the £35,000,000 obtained by British producers. The National Mark Campaign had shown that a demand existed mark campagn had shown that a demand existed for properly graded British produce, and the Bill would give and consolidate a great new market by setting up an organisation for stan-dardised produce. Its success would depend upon the loyal co-operation of producers. An element of compulsion was necessary, but ex-emptions would be allowed in some cases, such

as where producers consumed their own goods or had a regular private clientele, provided that there was no under-selling. He hoped that they might capture the London egg market, remedy the disorganisation of the milk trade by providing for the use of milk surplus to local consumption, and promote alliances between kindred trades. The second reading was agreed to by 258 to 213. In committee, a Conservative amendment to prevent under-cutting from outside prescribed areas was carried. The Lords made but slight amendments and these were accepted, the Royal

Assent being given on July 31.

SUNDAY ENTERTAINMENTS .- As a result of the ruling by the Courts that Sunday cinema performances were illegal under a century-old statute, the Government introduced a Bill to regulate Sunday performances, leaving members to vote as they wished. Mr. Clynes, moving the second reading on April 20, explained that the law of 1780, which governed Sunday performances, must either be amended or enforced. The Bill would give local authorities discretion as to which view should prevail in their areas, subject only to a guarantee that recreational facilities would produce revenue for charities and would not involve a seven-day week for any worker, and to proof being forthcoming of a substantial demand for such facilities in any area. Mr. Iau Macpherson moved the rejection of the Bill, which, he said, legalised illegality and commercialised Sunday It would, he declared, benefit Hollywood at the expense of Stratford-on-Avon Mr. Chamberlain pointed Stratford-on-Avon Mr. Chamberlam pointed on that the Bill would only sanction, and not compel, a practice prevalent during the last twenty years, and 8n John Simon reminder members that in 1780 the House imposed on the people what it thought good for them to believe, while in 1291, Parliament gave people the right to believe what they thought good. Samming up the case against the Bill, Sin Thomas Inskip said that it might force aso, coopseple to work on Sunday in London. The second reading was agreed to by mes to ze, and people to Work on Sunday in London. The second reading was agreed to by ags to an and the Bill was sent to a standing committee, but was subsequently abandoned, and a tem-porary measure was passed legalising, but not aftering, the practice existing before the ruling of the Courts.

#### THE NATIONAL GOVERNMENT.

LABOUR RESIGNS .- A sudden crisis arose within a few weeks of the adjournment as a result of the state of the country's finances. The Cabinet met daily but failed to agree upon methods of balancing the nation's Budget, and

Sept. 8, when both Houses received a message from the King intimating that the condition of the national dnances called for the imposition of additional taxation, and for economies in public expenditure. In the Lords, the Marquis of Reading, and in the Commons the Prime Minister, explained the situation. Mr. MacDonald said that by the third week in August temporary credits which had been arranged were practically exhausted. The position they had to face was something like a typhoon. He denied that bankers had ever interfered with political proposals, and said that if the country was to get a loan it had to balance the Budget and put its unemployment finance on a sound basis. Mr. Henderson, who had become Leader of the Opposition, said that he had agreed that the Budget must be balanced, but he could not accept the cuts in the unemployment benefit. The division on a formal motion was treated as a vote of confidence, and the Government secured a majority of 59

THE BUDGET BALANCED.—By the emergency Budget, opened by M1. Snowden on Sept xo, the finances of the nation were balanced and a pro-spective deficit of £170,000,000 was cleared—" an achievement which no country in the world has achievement which no country in the world has ever attempted," in the world so the Chancellor Nationally, he said, we had for some time been living beyond our means. The Unemployment Insurance Fund was costing the Exchequer about £ 100,000,000 this year, and the Government had decided that borrowing for that Fund and the Road Fund must cease. Based on the existing taxes and expenditure, he obtained an estimated deficit on the year's Budget of £74,000,000, but, looking alread, he found the appalling figure of £72,000,000 deficit on hext year's Budget. of £170,000,000 deficit on next year's Budget Mentioning that nine-tenths of the items under which economies were proposed were approved by the late Government, Mr. Snowden said that the Government had decided that the proposed sinking Fund provision should be £32,500,000, which, with certain necessary adjustments, produced a saving of £13,500,000. He proposed to increase the standard rate of income tax for the current year by 5d., making it 5% in the pound, and to alleviate the burden of the increase on industry the allowance made in respect of wear and tax on plant and mechanics would wear and tear on plant and machinery would be increased by so per cent. A very large number of persons at present paying no income tax would be brought within the range of payers by re-ducing the personal allowance for a single person from £135 to £100, and for a married person from £225 to £250, while the allowances for children would be reduced from £60 to £50 for the first child, and from £50 to £40 for other children. The amount on which half the standard factor would be paid was reduced from £250 to £175, but the allowance in respect of earned income would be increased from one-sixth, with Income would be increased from one-sixth with a maximum of £350, to one-fifth, with a maximum of £350. He expected a yield from the changes of £35,000,000 this year, and £55,500,000 next year. In addition he anticipated £4,000,000 this year and £6,000,000 next year from an increase of roper cent, on the amount of the surtex bill. The duties on all ordinary descriptions of hear would be forevered. methods of balancing the nation s budget, and amount of the sureax out. The cueses of an incident descriptions of beer would be forceased two days later Mr. MacDonald formed the National Government, the Cabinet consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the consisting of the

pence charged for admission. From these four changes he hoped to receive £11,50,000 this year and £24,000,000 next year. Thus, said the Chancellor, against the estimated deficit of this year of £74,579,000 he would secure £76,200,000, a surplus of £1,500,000, and in regard to next year the changes would bring in £71,500,000 against the estimated deficit of £70,000,000. Finally, Mr. Snowden said that the Finance Bill would include clanes to facilitate the conversion of the 5 per cent War Loan to a lower rate of interest. He had tied, he declared, to spread the burden as fairly and as evenly as human ingenuity could devise, and he believed that the country would accept the proposals and give the world an example of the indomitable British spirit in the face of difficulty. Mr. Graham criticised mainly the "cut" in unemployment benefit, and Mr. Runciman suggested that the importation of foreign luxuries should be prohibited. The Finance Bill was brought in on \$29t. 17, and the second reading was obtained six days later by 297 to 238. When the third reading was agreed to on Oct. 2, Mr. Suowden claimed that it would place the country's finances on a sound basis. The Bill went through the House of Lords and received the Royal Assent on Oct. 5.

in teachers salaries, and police and services pay, the Prime Minister said that the reduction in unemployment insurance seemed to be the hardest of the economies. They had adopted the straightforward course of taking off a percentage based upon the decreases in the cost of living and increases in the value of money, and he contended that the state of the unemployed was 1½ per cent. better than two years earlier. The second reading was carried by 320 to 253 on Sept. 14, and after several amendments had been defeated in Committee the third reading was agreed to by 297 to 242 on Sept. 28. Two days later it had been passed by the Lords and received the Royal Assent.

GOLD STANDARD SUSPENDED.—Yet another sensation came on Sept. 21, when it was announced that on the previous day the Government had decided, after consultation with the Bank of England, to suspend the Gold Standard for the time being. On the same day a Bill for this purpose was passed through all its stages and received the Royal Assent. Mr. Snowden explained that it suspended the obligation of the Bank to sell gold until such time as that obligation was restored by Royal Proclamation, indemnified the Bank for refusing to sell gold that day, and gave the Treasury power during the next six mouths to make and vary any measures they wished for controlling the exchanges. Mr. Henderson said that there was no need for panic, but he did not dispute the necessity for emergency powers.

THE DISSOLUTION—After the passage of a Bill to prevent the exploitation of foodstuffs, the Prime Minister announced on Oct. 6 that Parliament would be dissolved on the following day, and that polling day for the new House of Commons would be Oct. sp. In the King's Speech, read on the prorogation, His Majesty expressed himself confident that every eitzen would co-operate in restoring prosperity to the nation.

#### OFFICERS OF THE HOUSE OF COMMONS.

Speaker (re-elected Nov. 3, 1931), Capt. The Rt. Hon. Edward A. FitzRoy, N.P. for Daventry £5,000

#### THE GENERAL ELECTION OF 1981.

The result of the General Election of 1931 is shown in tabular form below. The Electorate numbered approximately 30,000,000, and if the voters in uncontested constituencies (2,358,000) are deducted the number of electors who recorded their votes amounted to seven-minths of the remainder. In 1832 the electors numbered about 1,000,000, increased to 2.500,000 in 1867, 5,000,000 in 1884, 21,000,000 in 1807, 1918 (when women of 30 were enfranchised), and to 28,850,000 in 1929 (women having the vote on the same terms as men).

[&]quot;Right Honourable."—Members of His Majesty's Most Honourable Privy Council are entitled to be designated "The Right Honourable," but, in practice, this prefix is sometimes absorbed in other designations; for example, a Prince of the Blood admitted a Privy Counsellor remains "His Roya Highness"; a Duke remains "His Grace", a Marquess is still styled "Most Honourable" In the case of Early, Viscounts and Europs a question has lately been raised whether peers of these three degrees are entitled to be called "Right Honourable" if not Privy Counsellors. While not presuming to make attenuent in settlement of the question, the Edutor feels bound to direct attention to the recital of Modes of Address of Peers of these three degrees (on pages 173, 172 and 122 of present Edition). The Style appearing these headings has been 'ecited in this manner for more than sixty years in Wurrears, and appears to be evidence of a long-standing cuttom, moreover, it is borne out in each instance, in A Musical of Dignitics, by C. R. Dodd (Whittaker & Co. 1842), and in The Book of the Court, by W. J. Thoma, P.S.A., "Dedicated by Command to the Queen" (H. G. Bohn, 1844). Earlier evidence of the courtesy could no doubt be produced. Chief Magistrates entitled to the prefix are found on p. 532.

# Government and Public Offices.

#### ONOTE AS TO SALARIES.

THE salaries shown in the 1932 WHITAKER, in the case of H.M. Judges and of Government Departments, are subject to abatement in accordance with the decisions of His Majesty's Government. These abatements, which are set out in Command Paper Number 3952, in various Treasury Circulars, and answers to Parliamentary questions. may be summarised as follows:

#### (a) Ministerial valaries

£5,000 a year and over, 20%; £2,000 a year and over, but under £5,000, 25%; under £2,000 a year, 10%.

(The salaries of the Attorney-General and Solicitor-General have been reduced to £3,000 a year plus fees.)

(b) Other salaries

£5,000 a year and over, an abatement of 20%; £2,000 a year and over, but less than £5,000, x0%, subject to the proviso that the remuneration of any officer in receipt of over £4,000 a year, but less than £5,000, shall be x0% less or such larger amount as will suffice to reduce his remuneration to

£4,000. Salaries of £1,800 a year and over, but less than £2,000; such abatement as will suffice to reduce remuneration to £1,800.

#### THE COST OF LIVING BONUS

In the year 1920, in order to counteract the increase in the Cost of Living the Government introduced a Cost of Living Bonus Scheme, under which salaried Civil Servants and wage-earning Government employees receive temporary additions to their salary or wages. The scheme was applied, irrespective of age or sex, as from was applied, irrespective of age of act, as from March; a pass, the limit of the addition in any case being £750 per annum. In general, salaries under £2,800 a year, except where described as inclusive, are supplemented by the grant of a cost of living bonus on a sliding scale.

The Government Scheme was adopted generally

by Public Authorities, certain modifications being made in particular instances

The standard cost of living in March, 1920, was 230 per cent. in excess of that of July, 2224, and the scheme of increase agreed by the Whitley Council on the basis of that figure was as follows:

the basis of that figure was as follows:—
Where the ordinary rate of remuneration does not
exceed 30s per week—320 per cent, increase
Where the ordinary rate of remuneration exceeds
gs a week, but does not exceed £500 per annumrape per cent on the first 30s a week k£61 s per
annum and 60 per cent on the excess over £61 gs
Where the ordinary rate of remuneration exceeds
£500 per annum—250 per cent, on the first £61 ss.,
65 per cent, on the next £60 ss., and a5 per cent on
the amount in excess of £500 up to £500.

The standard rate rises or falls z twenty-sixth in response to every five points rise or fall in the Index figure average of prices over a six months

In addition to the reduction caused by the automatic decline of the cost of living figure the following decreases have been introduced :-

so per cent, on substries from £500 to £500, ag per cent on substries from £500 to £500, so per cent. on substries from £500 to £500, and so on until 60 per cent. in reached in the case of salaries of £1,500 a Year.

From September, 1931, bonus is related to an average cost of living figures of go per cent. over the rors level.

The following are examples of the bonus at present payable (i.e. the standard rate, decreased by sixteen twenty-sixths):-

Annual	Bonus	Weekly	Bonus
Salary.	Sept., 1931.	Wages.	Sept , 2931
£ 90 150 200 250 400 500 600 700 800 900 1,000	45 0	м. d.	8. d.
	59 4	14 о	7 o
	70 14	15 о	7 6
	79 8	17 о	8 6
	88 0	18 о	9 o
	105 7	30 о	15 o
	122 13	40 о	18 8
	126 0	50 о	90 11
	133 13	60 о	23 3
	143 18	70 о	25 7
	145 9	80 о	27 8
7 750	50 0	100 0	31 Z

Further examples, showing the bonus expressed as percentage of salary, are appended :-

Halary	Bonus	Bonus expressed as Percentage of Halary
£	£ 8	7
90	45 0	50
150	59 4 70 8	39'5
250	79 8	31.8
500	122 13	24'5
1,000	146 9	14'6
1,500	133 #	8.0
1,750	50 0	2'9

Payment of bonus is subject to the proviso that no bonus is payable so as to bring total remuneration, inclusive of bonus, above f.z.800.

#### SMINISTRY OF AGRICULTURE AND FISHERIES.

Whitehall Place, S.W. x: 43 Parliament Street, S.W. x, 7, Old Bailey, E.C. 4; 8 Buckingham Gate, S.W. z.

THE MINISTEY OF ARREQUIVINE AND FISHERIES was constituted purposent to the Ministry of Agriculture and Hisheries Act, 2929 [9] and 10 Geo. V (In. 91 which amended the Board of Agriculture and Fisheries Act, 2589 to 2909. The Board of Agriculture for Great Britain was established in 1889. THE COUNTY PALATINE OF DURHAM.

THE OUUTTY PALATINE OF DURHAM.

It is uncertain when "Palatine" privileges were first exercised in the County of Durham, as no formal creation of the Palatinate by charler or deed appears to have ever been made. From the founding of the Nee of Lindistame, out of which the hishopric and palatinate of Durham arose, the lishops received large transit of lands, with extensive immunifies; and durhed, king of Northmutha, and Alfred the ireat appear to have comfirmed the grint of the test appear to have confirmed the grint of the test appear to have confirmed the grint of the test appear to have confirmed the grint of the Conqueror, and they were exercised by the Frelates until resumed by the Verwin 1 mag. Falatine counties are understood to have been erected for the defence of neighbouring king dome against the Welsh and Scota, and were in reality self-contained kingdoms in alliants with their creator. The ancient customs of the County Palatine of Jurham are in some measure retained, the activity of Purham are in some measure retained, the Alex Crown.

Concoller, and Herbert F. Manisty, a condition of the County Palatine of Jurham are in some measure retained, the Alex Crown.

Concoller, and Herbert F. Manisty, a condition of the County Palatine of Jurham are in September of Chemory Court, A. O. Smith Recovery of Crest of Hallotte, 1.8 Believer of M. Sladden.

Deputy do., A. de Bock Porter, 1.1.8 Registrar, G. M. Sladden. Mining Surveyor, Sir A. N. Lindsay Wood, Bt. Receivers, Smiths, Gore & Co.

# ECCLESIASTICAL AND CHURCH ESTATES COMMISSIONERS.

z Millbank, Westminster, S.W. z. (Hours 10 to 5.) The Ecclesiastical Commission for the Management of The Ecclesistical Commission for the Management of Church Property, as now existing, was incorporated in sign, its constitution being amended in sign-2 and sign free main function of the Commission (whose members are given below is the management of the Estates of the Church in order to endow or augment benefices, &c. Simaar of Richard and Experturear (Extracted from Annual Report presented to Parliament)

#### GENERAL REGISTER OFFICE (ENGLAND AND WALES).

(ENGLAND AND WALES),

Somerset House, W.C. z.

The Registration of Births, Marriages and Deaths is believed to have been inaugurated by Thomas Croming In the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the State of the Sta

receipts from fees for the same period is £56, 500.

Quarterly Skitstics.—In the Registrar-General's report, for the June quarter of 1931, the estimated birth rate is given as 165 per 1,000 population, which is the layest birth rate recorded in any second quarter of a year since the establishment of civil registration. The estimated death rate was 125 per 1,000, this being 03 per 1,000 about the rate recorded during the second quarter of last year. The natural increase of population for the June quarter, 1932, by excess of births over deaths was 49,174 as against 50 825, 59,723 and 58.389 in the second quasters of 1938, 393 and 1830 required in the March quarter of 1931 was 49,350, as decrease of 4,365 compared with the number of persons married in the March quarter of 1931 was 1930 consulted with the number in the corresponding quarter of 1939. The number corresponds to an annual rate of 9.5 per 1,000 of the pre liminary 293 Consus population.

Seconded for duty as an Acting Principal in the Home Office.

# POLITICAL HONOURS SCRUTINY COMMITTEE.

The Royal Commission on Honours, 1982, recommended that a Committee should be appointed to consider, before they are submitted to the King the names and particulars of persons recommended for appointment to any dignity or honour on account of political services, and after such inquiry as they think fit to report to the Prum Minister whether, so far as they believe, such persons in the whole circumstances are fit and proper persons to be recommended hecretary, James Rae (Treasury, S.W. z).

#### IMPERIAL ECONOMIC COMMITTEE. 2 Queen Anne's Gate Buildings, S.W. z.

a Queen Anne's Gate Buildings, S. W. I.
This Committee was established in 1995, following on proposals of the Imperial Economic Conference, 1993, for the purpose of considering the possibility of improving the methods of preparing for market and marketing within the United Kingdom, the products of the Overseas parts of the Empire, with a view to increasing the consumption of such produces in the United Kingdom in preference to imports from foreign countries, and to promote the interests both of producers and consumers from the Committee of the Committee of the Committee in the following terms of reference to the Committee in the following terms of reference.

(a) To investigate the marketing of Empire foodstuffs in the United Kingdom

(a) To undertake inquires into the production for export and the marketing in various parts of the world of raw materials of the Empire (3) To prepare, at the instance of the Governments of the Commonwealth, surveys of any branch of Empire trade and marketing

(4) To carry out certain in estigations adopted by the imperial Conference, zgg of 59 To facilitate conferences among those engaged in particular industries in various parts of the major.

(6) To examine and report on any economic question which the Governments of the Empire may agood to refer to the Committee.

The Committee has published eighteen reports: The

The Committee has published eighteen reports: The first a general report, and reports on meat, fruit, dairy produce, fish, poulity and eggs, honey, functions and work of the Committee, tobacco, timber, agricultural machinery, pigs and pig products, the trade of the British Empirer, rubber manufactured goods, hides and skine, progress report (1939), tea and coffee 'charmana, Sir Svidery J. Chapman, E.C.B., C.B.E. Sceretary, Sir David Chadwick, C.S.I., C.I.E.

#### IMPERIAL SHIPPING COMMITTEE,

IMPERIAL SHIPPING COMMITTER,

Set up in 1980 (1) To enquire into complaints from persons and bodies interested with regard to cease freights, racilities and conditions in the inter-imperial trate or questions of a similar nature referred to them by any of the nonmating authorities, and to report their conclusions to the flowerments concerned (1). To our seasons to the other than the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of struction or harbour works and similar matters; and so doing to take into account facilities for air transport on the routes in question. § H.M. LAND REGISTRY,
Lincoln's Inn Fields, W.C. a; and z8 Portugal

Street, W.C. a.

H M Land Registry was established in pursuance of a
recommendation of a Royal Commission by the Land
Registry Act. 256. The aim of the Act was to render
dealings with land more simple and economical by establishing a State register of landowners who voluntarily
submitted the titles to their land for examination and
approval by the Registrar on behalf of the State. The
Registry was reformed by the Land Transfer Act. 257,
which, while making many changes in the system, continued its voluntary basis. In 1897 the Land Transfer
thrused its voluntary basis. In 1897 the Land Transfer
and four Orders in Council under that Act between 1898
and 2008 made the system compulsory on sale in Eastbourne, and under an order made in 1988
in Hastings The Land Registation Act 1995 consolidated the previous Acts and made such changes in the
system as the experience of a generation had shown
to be necessary. The keynote of the system is that the
machinery for the pure base and sale of land is activated
the land Registry was east and the semilated to
the Land Registry regustred by the State
chimple forms, analogous to those used on transfers of
Stocks and Shares, are provided. The cost of buying,
selling or mortgaging registered land is much less thun
the cest in the case of unregistered land. It is open to
any County Council for council of a County Borough to
apply to the Privy Council for an order making registration of title compulsory in its area. The Land Registry
is administered under the Lord Chancelor by the Other
Land Registry was east. The Land Registry
is administered under the Lord Chancelor by the Other
Land Registry and associated the Middlessex Decisi
Registry and the Land Charges Department under the
Land Charges Act 1898

# METROPOLITAN WATER BOARD.

173 Rosebery Avenue, E C. 1.

The Board serves an area of 273 at miles. The charges are levied on net sanual value at such rate, not exceeding the such manual value at such rate, not exceeding the beard may far. The net water rental attempts of the beard may far. The net water rental formers are such as a such seed to 54,494,48, the interest paid being 54,500,266. The estimated population supplied was 7,675,495, the number of services being 1,305,495. The sanual supply was 102,471,274,000 gallons (representing 45,500,000 tone), a daily average of 278 million gallons. One of the sources of supply is the New Ruser Company's undertaking, inaugurated in the raten of James I (260g) by Sir Hugh Myddelton, to bring water from Amwell and Chadwell, Hortz, to London. Obtainman of the Metropolitical Water Board, Sir W Prescott, o B m, ni. (unp)

Jennings, FINTA. ..... Director of Water Examination, Sir Alexander 

#### OTHE ROYAL MINT. Tower Hill, E. z.

Admission by order only, application for which should be made to the Deputy Master of the Mint, about 4 weeks in advance of intended visit. Hours of admission, so to 3 Mon. to Fri.

The Royal Mint, as now constituted, may be said to date from 1817, and the buildings from 1810, the latter being completed in that year at the cost of over 7820,000. The first known Masten (or Warden) of the Mint dates from Henry I, and the last Warden was Lord Maryborough 1814-29), the last Master being Professor Thomas Graham, who died in 1856. In 1870 the Coinage Act abolished the ancient post of Master of the Mint as such, and combined it with that of the Chancellor of the Krchequer The estimated administrative expenses amount to £2,725,000 for 1923-1923 Appropriations in aid, £2,855,000, leaving a net cost of £200,000.

#### Branches of the Royal Mint.

Whitehall, S.W. z.

The Paymaster General & Office was formed by the consolidation in sign of various separate pay departments then existing, some of which dated back at least to the Restoration of side. Other offices were incorporated in side. Its function is that of paying sgent for the different Government Departments, other than the Revenue Departments. The majority of its payments are made through banks (to whose accounts the necessary transfers are made at the Bank of Regisand), but cash payments are also made, and the payment of pendions is an important feature of its work. The Establishment expenses were estimated at £58,000 in 1931-32.

Paymaster General (see p. 169) .. Assistant Paymaster General, Roland Wilkins, c B.
